and a rustic one—a language of books and of the higher classes, and a language of conversation and everyday life among the vulgar. It was in the last years of the republic and the first of the empire that the polished language reached its highest point of perfection in the writings of Cicero, Horace, Virgil, and others. But by the influx of strangers, by the gradual decline of Roman feelings and Roman spirit, and by the intermixture of the classic forms with the dialects of the provinces, it became corrupted, the process of deterioration going on with double rapidity after the dismemberment of the Roman empire in the 5th century. Thus were formed the modern French, Spanish, Italian, and Portuguese. The English language also owes much to Latin, both directly by derivation from the classical forms, and at second-hand through the Norman-French. Latin continued to be the diplomatic language of Europe till a comparatively recent period. It is still the medium of communication among the learned of the world, and is now, as it has always been, the official language of the Roman Catholic church. For a discussion as to the origin and sources of the Latin language, see Donaldson's *Varroianus*.

The grammar of the Latin language has been studied and illustrated by many celebrated scholars from Varro (116–28 B.C.) down to Zumpt, Grotewald, Kuhner, and Madvig, through a long list of names, such as Donatus, Priscian, Laurentius Valla, Manutius, Melanchthon, Scaliger, Perizonius, Schneider, Linacre, Ruddiman, Alvarez, and many more. In lexicography, Perotti, Stephanus, Faber, Gesner, Forcellini, Scheller, Freund, Georges, and others of less note, have done valuable service.

Literature.—The Roman republic had well-nigh run its course ere it possessed a writer or a literature worthy of the name. A kind of rude poetry was cultivated from the earliest times, and was employed in such compositions as the Hymn of the Fratres Arvales (dug up at Rome in 1778, and in the first burst of enthusiasm excited by its discovery, assigned to the age of Romulus), in the sacred songs to particular deities, and in triumphal poems and ballads, in the Fescennine Carols, and other rude attempts to amuse or dupe an illiterate and vulgar populace. And even when, in later years, the Romans did begin to foster a literary taste, the rage for Greek models hindered every effort at original thought. It was considered highly meritorious to imitate or translate a Greek writer; while, on the other hand, it was deemed dishonorable to follow a Latin author. Such was the feeling even in the days of Horace and Virgil, both of whom are largely indebted to their Greek models. The first period of Roman literature may be said to extend from 240 B.C. to the death of Sulla (78 B.C.); the second, or golden age, from the death of Sulla to the death of the emperor Augustus (14 A.D.); the third, or silver age, from the death of Augustus to the death of Adrian (138 A.D.), and the fourth from the death of Adrian to the overthrow of the western empire in 476 A.D. In the first period the most distinguished names are those of Livius Andronicus, a writer of dramas adapted from the Greek, whose first play was brought out in 240 B.C.; Ennius, whose chief work was an epic poem on the history of Rome, and who also wrote dramas and satires; with Naevius, Plautus, and Terence, the comedians. The second period is adorned by Varro, who wrote on agriculture, grammar, antiquities, etc.; by Lucretius, a writer of the didactic epic; by Virgil, who, to his great epic, the *Aeneid*, added pastoral and agricultural poetry in the *Eclogues* and *Georgics*; by Horace, in lyric verse and in satire; by Catullus, in lyric; by Tibullus and Propertius, in elegy; by Livy, Caesar, Sallust, and Nepos, in history and biography; by Cicero, in philosophy, rhetoric, and oratory; and by Ovid, in elegiac and didactic poetry. The third period boasts of Tacitus, the historian and biographer; of the elder Pliny, the naturalist; of Persius and Juvenal, the satirists; of Martial, the epigrammatist; of Columella and Lucan, the didactic and epic poets; of Statius, Silius Italicus, and the younger Pliny, with many others of lesser note. The fourth period produced few men of name; but among those who are best known may be mentioned the emperor M. Aurelius, Ammianus Marcellinus, Gellius, Justin, Appuleius, Lactantius, Eutropius, Macrobius, Calpurnius, Boëthius, Paullinus, and Claudianus, the last of the Roman classic poets.

The spread of Christianity gave rise to the ecclesiastical poetry of the middle ages, which departed from the classic models, and struck out for itself a new type. It disregarded the restrictions of quantity and meter, and substituted accent and rhyme as the regulating principles of its form. The most famous name in the earlier period is that of Prudentius—to whom we may add Sedulius, St. Hilary, St. Ambrose, and St. Gregory the great; and in the later period, Fortunatus; the emperor Charlemagne, author of *Veni Creator*; Bede (the venerable); Bernard de Morley; Adam of St. Victor; Thomas of Celano, author of the famous *Dies Irae*; James de Benedictis, author of the equally famous *Stabat Mater*; and St. Thomas Aquinas.—See the histories of Latin literature by Bernhardy, Munk (2d ed. 1877), and Teuffel.

LATIN UNION. By the monetary treaty of Paris of Dec. 23, 1865, France, Belgium, Switzerland, and Italy entered into a mutual agreement concerning the monetary and coinage policy, which took effect Aug. 1, 1866. That association of states is called the Latin union. Greece and Roumania came into the association in April, 1867. The following is the substance of the treaty:

Article 1. "Belgium, France, Italy, and Switzerland unite to regulate the weight, title, form, and circulation of their gold and silver coins. No change is made for the present in legislation relative to copper coins for the four countries."

Art. 2. "The high contracting parties bind themselves not to coin, or permit to be coined, any gold other than in pieces of 100, 50, 20, 10, and 5 francs in weight, standard, tolerance, and diameter as follows: All these coins shall be of the fineness or standard of .900, with a tolerance of two thousandths above or below the legal standard. The tolerance in weight shall be, for the 100 and for the 50 franc pieces, one-thousandth above or below; for the 20 and 10 franc pieces, two-thousandths; for the 5 franc pieces, three-thousandths. [The weights and diameters of the gold coins here follow in French measure. ED.] The different states will receive all the above coins when not worn to one-half per cent, or the devices effaced."

Art. 3. "The contracting governments bind themselves not to coin, or permit to be coined, silver pieces of 5 francs except of the weight, standard, tolerance, and diameter fixed."

Art. 4. "The contracting parties will coin hereafter pieces of 2 and 1 franc, 50 and 20 centimes, only to the fineness of .835; tolerance of standard $\frac{1}{1000}$ th; of weight $\frac{1}{1000}$ for the first two, $\frac{1}{1000}$ for the 50 centime piece, and .01 for the 20 centime piece." [Here follows the French weight and measure of the silver coins. ED.]

Art. 5. [Stipulates for the withdrawal and recoinage of silver pieces of 2 francs and under, not of the required standard, within a stipulated time]

Art. 6. "The silver coins authorized in article 4 shall be a legal tender between individuals of the state in which they are issued to the sum of fifty francs. The nation issuing them shall receive them in any amount."

Art. 7. "The public banks of each of the four countries will receive the coins of article 4, to the sum of 100 francs, in payment to said banks." [The remainder of the article relates to exceptions for Swiss coins.]

Art. 8. "Each of the contracting governments binds itself to receive from banks or individuals the small coins they have issued, and return the equivalent in current coin (gold, or 5 franc silver pieces), provided the sum presented be not less than 100 francs. This obligation shall extend two years beyond the expiration of this treaty."

Art. 9. "The high contracting parties agree not to issue a greater amount of these 2 and 1 franc, 50 and 20 centime pieces of article 4, than six francs for each inhabitant. The amount thus fixed in accordance with the last census and the presumed increase of population is fixed at (1866), for Belgium, 32,000,000 francs; for France, 239,000,000 francs; for Italy, 141,000,000 francs; for Switzerland, 17,000,000 francs. Exclusive of the above sums, the different governments can issue of coins already in circulation in the following proportion: France, in 50 and 20 centime pieces, by the law of May 25, 1864, about 16,000,000 francs; Italy, in 2 and 1 franc, 50 and 20 centime pieces, by the law of the 24th of Aug., 1862, about 100,000,000 francs; Switzerland, in 2 and 1 franc pieces by the law of Jan. 31, 1860, about 10,500,000 francs."

Art. 10. "Hereafter the year of issue to be stamped on all the gold and silver coins issued by the four governments."

Art. 11. "The contracting governments shall annually state the quantity of their issue of gold and silver coins, and the amount collected for melting. They shall likewise give notice of important facts in regard to the reciprocal circulation of their issues."

Art. 12. "Any other nation can join the present convention by accepting its obligations, and adopting the monetary system of the union in regard to gold and silver coins."

Art. 13. [Binds the contracting parties to pass laws to carry out the foregoing agreements.]

Art. 14. "The present convention shall remain in force till Jan 1, 1880. If it be not repealed a year before the expiration of that term, it shall remain in force for an additional period of 15 years, and so on until repealed."

Art. 15. "The present convention shall be ratified, and the ratifications exchanged in Paris, within six months, or less time if possible." [It was so ratified.]

On Jan. 30, 1874, at a conference of the Latin union, a supplementary treaty was made between the high contracting parties, by which they agreed to limit the coinage for the year 1874, of 5 franc pieces, to 12,000,000 francs in Belgium; 60,000,000 francs in France; 40,000,000 francs in Italy; and 8,000,000 in Switzerland; in all, 120,000,000 francs; and the delivery of coins upon mint receipts of Dec. 31, 1873, to the amount of nearly 50,000,000 francs, was applicable on these quotas. By a special article, Italy was allowed to coin, for the reserve of her national bank, 20,000,000 francs additional in 5 franc pieces.

The two annual conferences of the union in Feb., 1875 and 1876, made the same limitation for those years respectively, which were subsequently enacted by the respective governments; but a small additional issue was allowed to Greece in 1876.

The conference of 1877 entirely suspended the coinage of 5 franc pieces, except 9,000,000 francs for Italy.

By a law of Dec. 18, 1873, Belgium has the power to suspend the coinage of silver entirely. France passed a law to the same purport in 1876. Switzerland has one to the same effect. It will be observed that the treaty of 1865 limits the coinage of silver as to maximum, but does not make any coinage obligatory. The actual coinage, therefore, cannot be inferred from it.

In the autumn of 1878, through a conference in Paris, the same nations renewed their monetary treaty as it was, "in all that relates to fineness, weight, denomination, and currency of their gold and silver coin." Article 9 of the new treaty guarantees to each state free coinage of gold (excepting gold 5 franc pieces, of which the coinage is suspended), and provides that "the coinage of silver 5 franc pieces is provisionally suspended," but "it may be resumed when a unanimous agreement to that effect shall be established between all the contracting states." The treaty is in force by its term till Jan. 1, 1886. In 1875 Holland suspended the right of private individuals to have silver coined at her mint, which law is believed to be still in force. Being a party to the union, her act becomes a factor in the general policy of the union.

In view of the foregoing facts, and the further fact that France holds more than 2,500,000,000 francs in silver coin within her borders, it is not difficult to see that she has directed the legislation of the union with consummate ability to prevent a large decline in its value. Notwithstanding the suicidal attempts in the legislation of other nations to demonetize it, she has succeeded not only in saving her own capital in silver, without loss of value in its home circulation, but in acquiring it at reduced cost from her neighbors. See **MONETARY CONFERENCES, INTERNATIONAL**.

LATINUS, legendary King of Latium, son of Faunus and the nymph Marica, and father of Lavinia, wife of Aeneas, who, on the death of Latinus, succeeded to the throne of Latium.

LATITAT, an old form of writ in England which commenced an action in the court of queen's bench; now obsolete.

LATITUDE AND LONGITUDE, in geography, denote the angular distances of a place on the earth from the equator and first meridian respectively; the angular distance in longitude being found by supposing a plane to pass through the place, the earth's center, and the poles, and measuring the angle made by this plane with the plane of the first meridian; the angular distance in latitude being found in the same manner, but substituting the two extremities of an equatorial diameter for the poles; or, more simply, latitude is the angle made by two lines drawn from the earth's center—the one to the place, the other to the equator at the point where it is crossed by the meridian of the place. Latitude is reckoned from the equator to the poles, a place on the equator having lat. 0°, and the poles 90° n. and 90° s. respectively. Longitude is reckoned along the equator from the first meridian; but as nature has not, as in the case of latitude, supplied us with a fixed starting-point, each nation has chosen its own first meridian; thus, in Great Britain and her colonies, in Holland, and other maritime states, longitude is reckoned from the meridian which passes through Greenwich; in France, from that through Paris, etc.; and in many old charts, from Ferro (one of the Canary isles), or from the Madeira isles. It is reckoned e. and w. from 0° to 180°, though astronomers reckon from 0° w. to 360° w., and never use east longitude. It will easily be seen that if the latitude and longitude of a place be given, its exact position can be determined, for the latitude fixes its position to a circle passing round the earth at a uniform fixed distance from the equator (called a parallel of latitude), and the longitude shows what point of this circle is to be intersected by the meridian of the place, the place being at the intersection.

The determination both of latitude and longitude depends upon astronomical observation. The principle on which the more usual methods of finding the latitude depend will be understood from the following considerations: To an observer at the earth's equator, the celestial poles are in the horizon, and the meridian point of the equator is in the zenith. If now he travel northwards over one degree of the meridian, the north celestial pole will appear one degree above the horizon, while the meridian point of the equator will decline one degree southwards; and so on, until, when he reached the terrestrial pole, the pole of the heavens would be in the zenith, and the equator in the horizon. The same thing is true with regard to the southern hemisphere. It thus appears that to determine the latitude of a place we have only to find the altitude of the pole, or the zenith distance of the meridian point of the equator (which is the same thing as the complement of its altitude). The altitude of the pole is found most directly by observing the greatest and least altitudes of the polar star (see **POLE**), or of any circumpolar star, and (correction being made for refraction), taking half the sum. Similarly, half the sum of the greatest and least meridian altitudes of the sun, at the two solstices, corrected for refraction and parallax, gives the altitude of the meridian point of the equator. The method most usual with navigators and travelers is to observe the meridian altitude of a star whose declination or distance from the equator is known; or of the sun, whose declination at the time may be found from the *Nautical Almanac*; the sum or difference (according to the direction of the declination) of the altitude and declination gives the meridian altitude of the equator, which is the co-latitude. Other methods of finding the latitude require more or less trigonometrical calculation.

The determination of the longitude is by no means so readily accomplished. Various methods have at different times been proposed, most of which are only fitted for observatories. Among these may be classed those which depend upon the determination of the local time of the occurrence of certain celestial phenomena, such as the eclipses of

the sun, moon, or Jupiter's satellites, occultations of fixed stars by the moon, the time occupied in the moon's transit over the meridian, etc.; and comparing the observed local time with the calculated time of the occurrence, at some station whose longitude is known (e.g., Greenwich), the difference of time when reduced to degrees, minutes, and seconds, at the rate of 360° to 24 hours, gives the difference of longitude. The two methods in use among travelers and on board ship are remarkable for their combination of simplicity with accuracy. The first consists merely in determining at what hour on the chronometer (which is set to the time at Greenwich, or some place of known longitude) the sun crosses the meridian. It is evident that as the sun completes a revolution, or 360° , in 24 hours, he will move over 15° degrees in 1 hour, or 1° in 4 minutes. Now, if the watch be set to Greenwich time—viz., point to 12 o'clock when the sun is on the meridian of Greenwich, and if at some other place, when the sun is on the meridian there, the watch points to 3 hours 52 minutes, the difference of longitude is 58° , and the longitude will be w., as the sun has arrived over the place later than at Greenwich; similarly, if the sun be over the meridian of a place at 9 hours and 40 minutes A.M., the longitude is 35° e. (by the chronometer). The accuracy of this method depends evidently upon the correctness of time-keepers (see WATCHES). The other method—that of "lunar distances"—may be briefly explained as follows: The distance of the moon from certain fixed stars is calculated with great accuracy (about three years in advance) for every three hours of Greenwich time, and published in the *Nautical Almanac*. The moon's distance from some one star having been observed, and corrected for refraction and parallax, and the local time having also been noted, the difference between this local time and *that time in the table which corresponds to the same distance* gives the longitude, which may be converted into degrees as before. It may also be mentioned that the longitude of all places connected by telegraph with the reckoning-point can be easily found by transmitting from the latter a signal to an observer in the place, at a certain fixed time (reckoned in solar time at the reckoning-point), and by the observer instantly and accurately noting the local time at which the signal arrived; the difference of the two times, reduced in the way shown above, will give the longitude, the time occupied in the transmission of the signal being so small as to be neglected. When applied to a heavenly body, the terms latitude and longitude have the same relations to the ecliptic and its poles, and to the point on the ecliptic called the equinox (q.v.), that terrestrial latitude and longitude have to the equator and a first meridian. The positions of a heavenly body relatively to the equator are called its declination (q.v.) and right ascension (q.v.).

LATITUDINARIANS, in ecclesiastical history, a class of English divines in the reign of Charles II., towards the close of the 17th c., who were opposed both to the high tenets of the ruling party in the church and to what they regarded as the fanatical views of many dissenters. They considered as unimportant the matters of dispute between high-churchmen and Puritans, and endeavored to take a middle course between the strict Presbyterians and independents, on the one hand, and the more intolerant Episcopalians on the other. They were branded by both parties as deists and atheists as well as latitudinarians. They were generally low-churchmen, and their creed was nearly that of the Dutch Arminians. Among the prominent of this class were Hales, Chillingworth, Cudworth, Tillotson, Henry More, Wilkins, and Gale. They were raised to important places during the reign of Charles. Their principles were explained and defended by Fowler, bishop of Gloucester, in a work entitled *The Principles and Practices of Certain Modern Divines of the Church of England, abusively called Latitudinarians, Truly Represented and Defended, by way of Dialogue*. As a theological term it is now applied generally to those who hold opinions at variance with the more rigid interpretation of Scripture and church traditions. The name is given also to the modern broad-church party.

LATIUM, a country of Italy formerly occupied by the Latini, now covered by the Pontine marshes and uninhabitable. The Latins, one of the oldest known nations of Italy, are said to have migrated from the central Apennines, and settled the land between the Anio, the Tiber, the Alban mountains, and the sea, which was named Latium after them. Over these plains they spread themselves in small settlements, which grew into villages, and even became important towns long before the foundation of Rome. Among these towns were Laurentum, Lanuvium, Alba Longa, Tusculum, Aricia, etc. These Latin communities were united by religious rites, which were celebrated in a temple of Diana in a grove near Aricia; in a temple of Venus between Lavinium and Ardea; and elsewhere. The original deities of the Latins were Saturnus, Janus, and Faunus; Venus and others appear to have been introduced into their mythology at a later period. The towns of Latium were strongly built in positions favorable for defense, and surrounded by massive walls. This was a necessary precaution, as the growing wealth and power of the inhabitants brought them into conflict with their neighbors, the Volscians, and with Rome. From the time of Tullus Hostilius there was constant warfare with the latter country, until, under the consulship of Spurius Cassius and Postumus Cominius, in the beginning of the 5th c. B.C., a solemn league and treaty was established between Rome and Latium, which existed for about 100 years. But after the conclusion of the invasion of the Gauls, and when these barbarians had retired

from the ruined city, the Latins, Volscians, Etruscans, and other ancient enemies of Rome took advantage of her extremity to attack her. They were, however, defeated, and forced to make peace on terms favorable to Rome. This condition was not, however, permanent, the Latins being always aggressive, and jealous of the supremacy of Rome. The "great Latin war," as it is termed in history—said to be the greatest in which Rome ever engaged—occurred in 340 B.C.; lasted during 3 years; and ended in a decisive battle in the plain near the base of Vesuvius, in which Rome was entirely successful, and barely one-fourth of the Latins escaped. Soon afterwards they made their submission to Rome, and a portion of their land was taken from them. Then city after city of Latium was brought under subjection; the general assemblies of the Latins for self-government were abolished; the walls of Velitiae—a Latin city, formerly a Roman colony—were razed to the ground, and its senators banished; and thus terminated the existence of Latium as an independent state. It is said of Latium that probably never on the earth's surface were crowded together so many cities in so small a space. They numbered about 60 authentic towns, on an extent of territory 64 m. by 28 in dimensions. After their subjugation the inhabitants permitted their system of drainage and sewerage to become disordered; the water-courses stagnated; and in place of the thriving, busy plain, alive with bustling cities, there grew to be a vast swamp, unproductive and unhealthy, the present Roman Campagna. This locality is not only malarious, but in every way desolate and forbidding. The ground is volcanic, the many lakes which cover it being formed in craters. Hot sulphur springs exist in the district lying between Rome and Tivoli. The marshes which existed at the period when Latium was in its prime, but were drained in the inhabited portion, were the favorite habitat, in their unreclaimed part, of wild boars, which were hunted for the tables of the Roman aristocracy. Even at the present time, the Pontine marshes are famous for this species of game.

LATONA, in Grecian mythology, the mother of Apollo and Diana by Jupiter. When pursued by the jealous Juno, she finally found refuge on the floating island of Delos, which was made fast for her by order of Neptune. She had no temples, but was worshiped only in connection with her children.

LATOUE D'AUVERGNE, THÉOPHILE MALO CORRET DE, b. Nov. 23, 1743, at Carhaix, in Finistère, France, of an illegitimate branch of the family of the dukes of Bouillon. He entered the army in 1767; and in 1781 served under the duke de Crillon at Port Mahon. On the outbreak of the revolution he attached himself to the national cause. The army of the Alps, which operated against the Sardinians in 1792, contained no braver officer than Latour. He was the first to enter Chambéry, sword in hand, at the head of his company. But he would not hear of advancement in military rank; and, in the following year, though placed at the head of a column of 8,000 grenadiers, in the army of the Pyrenees, he continued to wear the uniform of a captain. His corps obtained the name of the "infernal column," on account of the dread which its bayonet-charges inspired. When he was subsequently with the army of the Rhine, in 1800, as he still refused all promotion, Bonaparte bestowed on him the title of "The First Grenadier of France." He was killed, on June 27 of that year, at Oberhausen, near Neuburg in Bavaria. The heroism and magnanimity of Latour were wonderful; and French biographies are full of instances of his daring valor, his Spartan simplicity of life, and his chivalrous affection for his friends. When he died, the whole French army mourned for him three days; every soldier set aside a day's pay to purchase a silver urn to hold his heart; his saber was placed in the church of the Invalides; and each morning, till the close of the empire, at the muster-roll of his regiment, his name continued to be called, and the oldest sergeant answered to the call: "*Mort au champ d'honneur*" (Dead on the field of honor). Latour was not only a brave warrior, but also a man of a studious disposition, and the author of two works, *Nouvelles Recherches sur la Langue l'Origine et les Antiquités des Bretons* (1792), and *Origines Gauloises* (1801), which is, however, only a third edition of the former.

LA TRAPPE, a narrow valley in Normandy, in the department of Orne, closely shut in by woods and rocks, and very difficult of access. It is notable as the place in which the Trappists (q.v.) originated.

LATREILLE, PIERRE-ANDRE, an eminent naturalist, b. in 1762 at Brive, in the department of Corrèze, France. In 1778 he was placed in the college of cardinal Lemoine, at Paris, to be educated for the church. Here he acquired the friendship of Haüy (q.v.), and devoted himself almost exclusively to the study of insects. He completed his education for the church, and received ordination, but gave himself, however, chiefly to entomological studies. His first publication was on the *mutillas* of France, insects of the order *Hymenoptera* (1792); which was followed by very many other works of the same kind, articles in encyclopædias, magazines, etc. In 1796 he published, at Brive, his first great work, *Précis des Curiosités Génériques des Insectes, disposés dans un Ordre Naturel*. It was an important step towards a truly natural system of entomology, although really a mere sketch of a system. An interesting incident falls here to be mentioned. During the fury of the French revolution, Latreille was condemned to *déportation*, and sent to prison at Bordeaux, awaiting the execution of his sentence. The surgeon who visited the prison observing the prisoner attentively look-

ing at a small insect (*necrobia ruficollis*), was informed by him that it was very rare, and that he wished to transmit it to two young naturalists in Bordeaux. His wish was gratified, and the young naturalists—MM. Dargelas and Bory de Saint-Vincent—exerted themselves to obtain his release, in which they ultimately succeeded. Latreille always remembered this with great gratitude, and has commemorated the incident in some of his works. A figure of the insect is engraved on his tomb. Latreille was again in danger in 1797, when he was proscribed as an *émigré*; but again he escaped through the influence of friends. Having, after the revolution, relinquished all thoughts of the church, he entirely devoted himself to natural history; was received as a corresponding member of the institute; and was employed in the arranging of insects in the museum of natural history. He died at Paris, Feb. 6, 1833, at the age of 70. His works on natural history are very numerous. The most important, besides those already noticed, are: *Histoire des Salamandres* (Par. 1800); *Histoire Naturelle des Singes* (2 tom., Par. 1801); *Histoire Naturelle des Crustaces et Insectes* (14 tom., 1802-5); *Histoire Naturelle des Reptiles* (4 tom. Par., 1802); *Genera Crustaceorum et Insectorum* (4 tom., Par., 1806-9); *Considerations sur l'Ordre Naturel des Animaux*, etc. (Par. 1810); *Familles Naturelles du Règne Animal* (Par. 1825); *Cours d'Entomologie* (2 tom. Par. 1831-33). Latreille contributed greatly to the present natural system of entomology; and his labors in other departments of natural history were not inconsiderable.

LA'TRINES, conveniences for soldiers in camps and barracks. Much attention has of late been devoted to their construction, a large percentage of the army sickness having been traced to their defective and impure condition.

LATROBE, BENJAMIN H., b. Philadelphia, 1806; a civil engineer and railroad manager; studied and practiced law for a few years, then became an engineer; in 1830 had charge of the construction of the Baltimore and Ohio railway between Point of Rocks and Harper's Ferry; and became chief-engineer of that road in 1842. He was afterwards chief-engineer and president of several railway companies, and an esteemed consulting engineer.

LATROBE, BENJAMIN HENRY, 1767-1820; b. England; d. New Orleans; an English architect who came to America in 1796, and had charge of the works for the improvement of the navigation of James river, Va., and soon after became state engineer; subsequently was employed by the U. S. government in constructing lighthouses and fortifications on the coast, and as inspector of public works. He designed the old national bank in Philadelphia, the cathedral and merchants' exchange of Baltimore, the old hall of the house of representatives at Washington; and died while engaged on the water-works of New Orleans.

LATRUNCULI, the name given to an ancient Roman game, whose origin is of unknown date, but attributed by some to Palamedes, to whom is also ascribed the invention of chess, backgammon, and dice. The game resembled chess in some respects, being played on a board, and with pieces of different colors. The number of pieces varied between five and twelve, and it was at first strictly a game of skill. Later, the introduction into it of the use of *tesserae*, or dice, brought into it the element of chance. It is possible that this was one of the first crude attempts, out of which gradually grew the game of chess.

LAT TEN, a term now seldom used. It is applied to sheet-brass, and previous to the reforms in the customs tariff, the name was regularly recognized. There are three varieties of latten known—*black*, *shaven*, and *roll*. The first is rolled brass about the thickness of ordinary pasteboard, and unpolished; the second as thin as writing-paper; and the third is either of the other kinds polished on both sides. The term latten is of some archaeological interest, as it is not known what is meant by the "mines of latten" mentioned in the time of Henry VIII., and frequent mention is made of this metal in various public records, without explanation of its nature.

LATTER-DAY SAINTS. See MORMONS, *ante*.

LAT'TICE-BRIDGE, so called from having the sides constructed with cross-framing resembling lattice-work (Fr. and Ger. *latte*, a lath). See FRAME-BRIDGE. Many very large bridges of this kind have been erected with timber-framing in America. That over the Susquehanna at Columbia is about $1\frac{1}{2}$ m. long, and has 29 spans, each 200 ft. wide. The principle on which many lattice-bridges are constructed resembles that of the trussed rafters of roofs, with a king-post or hanger in center. Each span consists of a series of these rafters, so arranged that the head of one rafter is immediately over the feet of the two adjoining rafters. Other lattice-bridges are constructed with diagonal braces, united with strong pins, and without suspension-rods. The former method is the stronger, as in the latter the strain comes chiefly on the pins uniting the diagonal cross-braces. Lattice-bridges are also constructed in iron, and have been much used for railway purposes. The first application of the lattice principle to iron was made by Mr. George Smart, who registered, in 1824, his "patent iron bridge." Many modifications of the same principle have been adopted—the horizontal ties at top and bottom being always of wrought iron, and the diagonals either simple wrought-iron bars, or hollow malleable-iron tubes, or of cast iron. The wrought-iron tubular

bow-bridge, now in very common use in railway construction, is a combination of the tubular and the lattice principle. See TUBULAR BRIDGES.

LATTICE LEAF, LACE LEAF, WATER YAM, or OUVIRANDRANO, *Ouvirandra fenestralis*, a plant referred by some botanists to the natural order *juncagineæ*, and by some to *naiadaceæ*. It is a native of Madagascar, and grows in running streams. It has a root-stock about the thickness of a man's thumb, 6 to 9 in. long, often branching, internally white, with a light-brown skin, farinaceous, and used for food. The crown of the root is under water, and the leaves float just under the surface; the flower-stalks rise above it. The flowers are in forked spikes. The leaves are very curious; the blade resembling lattice-work or open needle-work of a most regular pattern; the longitudinal ribs being crossed at right angles by fine tendrils, and the intervening spaces being open. The blade is of an elongated oval form, abruptly acuminate; the length of the stalk varies according to the depth of the water. The whole appearance of the plant is very beautiful. It grows well in hot-house aquaria in Britain.

LATTICED, or TREILLÉ, in heraldry, is a term applied to a shield covered with a decoration resembling fretty (q.v.), but differing in this respect, that the pieces do not cross over and under each other: those directed from dexter chief to sinister base are placed uppermost and *cloué*, that is, have nails inserted at the joints.

LATUDE, HENRI MASERS DE, 1725–1805; b. France; having served a number of years in the French army, began the study of mathematics in Paris. A trick, easily discovered, by which he hoped to gain the favor of Mme. de Pompadour, made him the victim of unmerited condemnation for the period of 35 years. In 1749 he attempted to prove his disinterested admiration for her by warning her of an attempt upon her life, to be made through a dangerous powder that she was to receive in a package. Finding that it emanated from him, a simple ruse to gain her favor, she caused his arrest, and with inexcusable obduracy kept him imprisoned in the Bastile and at Vincennes until her death. In 1750, 1756, and 1764 he made unsuccessful escapes; in the first instance voluntarily surrendering himself within a week, in the second being rearrested in Amsterdam, and the third time, soon after his transfer to the prison at Vincennes, he made his escape and was retaken. His imprisonment subsequent to the death of Mme. Pompadour is unaccountable, he having led a quiet, thoughtful life during incarceration, when not suffering from too rigorous treatment. In 1777, having been liberated through the intercession of Malesherbes, he was soon after arrested again, and kept in a dungeon at Bicêtre for many years. At length, in 1784, with the change brought about by a turn in political affairs, the popular voice being in his favor, he was liberated and pensioned, under the patronage of Mme. Legros. In 1793 he claimed damages from the heirs of Mme. de Pompadour, and received 10,000 livres. In 1789, besides several essays, he published *Mémoire de M. de Latude, ingénieur*; in 1791–92 *Le Despotisme Dévoilé, ou Mémoires de Latude* was published by Thierry; and in 1838 *Mémoires inédites de Henri Masers de Latude*.

LAUBAN, a t. of Prussia, in the province of Silesia, is situated in a charming valley on the Queis, 40 m. w.s.w. of Liegnitz. Pop. '75, 10,092, who are engaged chiefly in woolen, linen, and cotton weaving, bleaching, printing, dyeing, and bell-founding.

LAUBE, HEINRICH, 1806; b. in Silesia, became professor at Breslau, and in 1831 settled in Leipsic, to follow a literary career. In 1834 he journeyed in Italy. On his return to Germany he was implicated in the organization of the *Burschenschaft*, a secret organization of young Germans, mostly collegians, to promote progressive reforms in the German government. The royal government sought the suppression of this society, and Laube was imprisoned nine months in Berlin for his participation in its work. After his release, he renewed his connection with it, and was again imprisoned from 1837 to 1839. On his release he visited France and Algeria. After the revolutionary movements of 1848 he was made deputy from a Bohemian town to the parliament of Frankfort, and voted with the moderate party. In 1849 he went to Vienna and became director of the court theater, and remained twenty years. In 1869 he became director of the theater of Leipsic. He is a writer of lively powers of observation and wit, one of the recognized members of what is called the "young Germany" school in literature, and rather distinguished by the beauty of his style than the peculiarities or value of his thoughts. From 1832 to 1844 he was chief editor of fashionable and theatrical journals, and a prolific author. The following are among his works: *Das Neue Jahrhundert*, 1833; *Modernen Characteristiken*, 1835; *Geschichte der Deutschen Literatur*, 1840; *Das Erste Deutsche Parlament*, 1849; *Das Burgtheater*, 1868; *Französische Lustschlösser*, 1840; *Das Junge Europa*, 1833–37; and several dramas.

LAUD, WILLIAM, Archbishop of Canterbury, was the son of a clothier in good circumstances, and was b. at Reading, in Berkshire, Oct. 7, 1573. He entered St. John's college, Oxford, in 1589, became a fellow in 1593, and took his degree of M.A. in 1598. Ordained a priest in 1601, he soon made himself conspicuous at the university by his antipathy to Puritanism; but being then a person of very little consequence, he only succeeded in exciting displeasure against himself. Yet his learning, his persistent and definite ecclesiasticism, and the genuine unselfishness of his devotion to the church, soon won him both friends and patrons. In 1607 he was preferred to the vicarage of Stan-

ford in Northamptonshire, and in 1608 obtained the advowson of North Kilworth in Leicestershire. In both of these livings he showed himself an exemplary clergyman according to the high-church pattern—zealous in repairing the parsonage-houses, and liberal in maintaining the poor. In 1609 he was appointed rector of West Tilbury, in Essex; in 1611—in spite of strong opposition—president of St. John's college; in 1614, prebendary of Lincoln; and in 1615 archdeacon of Huntingdon. King James now began to recognize what sort of a man Laud was, and to see that he might rely on him as a valuable ally in carrying out the notions of the “divine right.” Not that their aims were quite identical—James was chiefly anxious to maintain the absolute authority of the sovereign, and Laud the absolute authority of episcopacy. In 1617 Laud accompanied his majesty to Scotland, with the view of introducing episcopacy into the church government of that country; but the attempt failed. In 1621 he was consecrated bishop of St. Davids. After the accession of Charles I. he was translated from the see of St. Davids to that of Bath and Wells, became high in favor at court, was more than ever hated by the Puritans, and was denounced in parliament. In 1628 he was made bishop of London. After the assassination of Buckingham (q.v.), Laud became virtually the chief minister of Charles, and acted in a manner so utterly opposed to the spirit of the times and to the opinions of the great body of Puritans in England, that one might have foreseen his ruin to be inevitable, in spite of the royal favor. In 1630 he was chosen chancellor of the university of Oxford, the center of high-church loyalty. From this period he was for several years busily but fruitlessly employed in repressing Puritanism. The means adopted were not only unchristian, but even detestable. Cropping the ears, slitting the nose, branding the forehead, fines, imprisonments, are not at any time satisfactory methods of defending a religious system, but in the then temper of the English nation they were in the last degree weak and foolish. In the high-commission and star-chamber courts, the influence of Laud was supreme; but the penalty he paid for this influence was the hatred of the English parliament and of the people generally. In 1633 he was raised to the archbishopric of Canterbury, and in the same year made chancellor of the university of Dublin. The famous ordinance regarding Sunday sports, which was published about this time by royal command, was believed to be drawn up by Laud, and greatly increased the dislike felt towards him by the Puritans. His minute alterations in public worship, his regulations about the proper position of the altar and the fencing of it with decent rails, his forcing Dutch and Walloon congregations to use the English liturgy, and all Englishmen to attend the parish churches where they resided, display a petty intellect and an intolerant spirit; as other of his actions indicate that there lurked in his small obstinate nature no inconsiderable amount of cruelty and malice. Still, it must be confessed that in the long run, Laud's ritualism has triumphed. The church of England was gradually penetrated with his spirit, and the high value which she has come to put on religious ceremonies is partly owing to the pertinacious efforts of the archbishop. This influence, in short, has hindered her from becoming as doctrinal and *Calvinistic* as her articles would logically necessitate. During 1635-37, another effort was made by him to establish episcopacy in Scotland; but the first attempt to read the liturgy in St. Giles's church, Edinburgh, excited a dangerous tumult. Proceedings were finally taken against him, and on Mar. 1, 1640-41, he was, by order of the house of commons, conveyed to the Tower. After being stripped of his honors, and exposed to many indignities and much injustice, he was finally brought to trial before the house of lords, Nov. 13, 1643, on a charge of treason and other crimes. The lords, however, did not find him guilty; but the commons had previously resolved on his death, and passed an ordinance for his execution. To this the upper house gave its assent; and in spite of Laud's producing a royal pardon, he was—undoubtedly in violation of express statute, and by the exercise of a prerogative of parliament as arbitrary as any king had ever exhibited—beheaded, Jan. 10, 1644-45. Laud had a genuine regard for learning—at least ecclesiastical learning—and enriched the university of Oxford, in the course of his life, with 1300 MSS. in different European and oriental languages; but his exclusive sacerdotalism, his inability to understand his fellow-creatures, and his consequent disregard for their rights, forbid us to admire his character, though we pity his fate. His writings are few. Wharton published his *Diary* in 1694; and during 1857-60, Parker, the Oxford publisher, issued *The Works of the Most Reverend Father in God, William Laud, D.D., sometime Lord Archbishop of Canterbury*, containing, among other things, his letters and miscellaneous papers, some of them not before published, and, like his *Diary*, of great value in helping us to form an adequate conception of the man and his time.

LAUDANUM, or TINCTURE OF OPIUM, is the most generally used of all the preparations of opium. It is obtained by macerating the sliced or powdered drug in spirit, and filtering. It is of a deep brownish-red color, and possesses the peculiar odor and smell of opium. One of the greatest objections to it is, that it is liable to great variations of strength. Dr. Christison remarks: “Laudanum is made by all the colleges with such proportions of the opium and spirit that about thirteen minims and a half, or about twenty-five drops, contain the entire part of one grain of opium. But the London tincture may be sometimes sixteen per cent stronger than the others, as dry opium is directed to be used.” This medicine is, moreover, very often adulterated.

Laudanum is a powerful anodyne and soporific, but is more liable to cause headache than the solution of one of the salts of morphia. Its general action and its uses will be described in the article OPIUM. The dose for an adult varies from ten minims to a dram. To children (as is the case with all opiates), it must be given with extreme caution. *One minim*, which is equivalent to the 120th of a grain of morphia, has been known to prove fatal to an infant.

LAUDA SION SALVATO'REM ("Praise the Saviour of Zion"), a rhymed Latin hymn by Thomas Aquinas, in 12 stanzas, sung in Roman Catholic churches on Corpus Christi Sunday. Nine of the 12 stanzas have six lines each, two eight lines each, and one, the last, ten lines.

LAUDER, ROBERT SCOTT, 1803-69; b. near Edinburgh; studied painting under the patronage of David Roberts and sir Walter Scott in Edinburgh and London, after which he spent five years in Italy. From 1838 to 1849 he resided in London, and after that time until his death in Edinburgh. His best works were scenes from Scott's novels. His "Christ Teaching Humility" was purchased by the Scottish association for the encouragement of art and placed in the Scottish national gallery at Edinburgh.

LAUDER, Sir THOMAS DICK, 1784-1848; b. Edinburgh; was first brought into notice by contributions to *Tait's* and *Blackwood's Magazines*—*Simon Roy, Gardener, of Dumphail*, being ascribed by some to the author of *Waverley*. In his youth he wrote *Lochandhu* and the *Wolf of Badenoch*. He read a paper on *The Parallel Roads of Glenroy* before the royal society of Edinburgh, which was published in vol. ix. of their *Transactions*. It consisted of a description of the geological strata of that district of the Highlands. He published also sketches of Scottish scenery under the titles of *Highland Rambles, with Long Tales to Shorten the Way*, 2 vols.; *Legendary Tales of the Highlands*, 3 vols.; *Tour Round the Coasts of Scotland*; and a *Memorial of the Royal Progress in Scotland* in 1842. He was for several years secretary of the board of Scottish fisheries and of arts and manufactures. He was a baronet, and was succeeded in his title by his son, sir John Dick Lauder.

LAUDER, WILLIAM, d. 1771; b. in Scotland early in the 18th c., and educated at the university of Edinburgh. He was a Latin scholar of some celebrity, but is remembered chiefly for a series of articles in the *Gentleman's Magazine* (1747) (afterward printed in a book with a preface by Dr. Samuel Johnson), in which he pretended to show that Milton, in *Paradise Lost*, had borrowed largely from modern Latin poems by Grotius and others. It afterward appeared that the work was an imposture, the parallel passages quoted to support the charge of plagiarism against Milton being ascertained to be either forgeries or taken from a Latin translation of *Paradise Lost*. Lauder confessed the fraud and went to Barbadoes, where he died.

LAUDERDALE, a co. in n.w. Alabama, has for its entire southern and western boundary the Tennessee river, and on the n. the state line of Tennessee; about 750 sq. m.; pop. '80, 21,035—20,838 of American birth, 6,809 colored. Cypress creek, rising beyond the border, flows southward, emptying into the Tennessee river, and Shoal creek takes a parallel course. By its southern border, where the Tennessee river is about 1½ m. in width, are the rapids called Muscle shoals, with a descent of 100 ft. in 20 miles. The surface is undulating, particularly in the northern section, with broad tracts of woodland. The soil is suited to the cultivation of cotton and tobacco; other products are those of the dairy, and honey, grain, and sorghum. Limestone and iron ore are found. It is connected with the Memphis and Charleston railroad by the Tuscumbria branch, and has a number of cotton factories in the south. Seat of justice, Florence.

LAUDERDALE, a co. in e. Mississippi, intersected by the Alabama Great Southern, the Vicksburg and Meridian, and the Mobile and Ohio railroads, which form a junction at Meridian; bounded on the e. by the state line of Alabama; about 700 sq. m.; pop. '80, 21,501—21,300 of American birth, 11,541 colored. It is drained by the head waters of the Chickasawha river, and has level, tillable lands, principally productive of corn, cotton, honey, rice, and sweet potatoes. Cattle, sheep, and swine are raised; value of all live stock in '70, \$284,179. Its manufacturing industries are few, and include the product of saw mills, sashes, doors, and blinds, and one or two cotton factories. Seat of justice, Meridian.

LAUDERDALE, a co. in w. Tennessee, having the Mississippi river for its w. boundary, separating it from Missouri and Arkansas, drained by Forked Deer creek, emptying into the Mississippi river, and by the navigable Big Hatchie river forming its s. boundary; 400 sq.m.; pop. '80, 14,918—14,843 of American birth, 5,839 colored. Its surface is generally level and well timbered, containing iron ore and limestone. Its soil produces fruit in abundance, wheat, rice, oats, corn, rye, tobacco, cotton, wool, sweet potatoes, and dairy products; cattle, sheep, and swine are raised. Cash value of farms in '70, \$2,536,980. It had in '70, 77 manufacturing establishments, employing a capital of \$55,025, with a product of \$280,338. Seat of justice, Ripley.

LAUDERDALE, JAMES, about 1780-1814; b. Va., and removed early in this century to w. Tennessee. He bore a prominent part in the Creek war under gens. Coffee and Jackson, and was killed in the first battle of New Orleans, Dec. 23, 1814.

LAUDERDALE, JOHN MAITLAND, Duke of. See MAITLAND, *ante*.

LAUDIAN MANUSCRIPT (CODEX LAUDIANUS), named after archbishop Laud, who in 1636 presented it to the university of Oxford, is a very valuable MS. of the Acts having in parallel columns and uncial letters the Greek text with a closely literal Latin version, different both from the Vulgate and from Jerome's. The Latin words are always exactly opposite the Greek. The portion from xxvi. 29 to xxvii. 26 has been lost. The vellum is inferior and the ink pale. It was probably written in the w. of Europe and about the 6th century. It is now in the Bodleian library, and is numbered 35. Readings were taken from it by Fell in 1675, and Mill in 1707. In 1715 Hearne published it in full.

LAUDOHN, or LOUDON, GIDEON ERNST, Baron von, 1716-1790; b. Totzen, Livonia; a distinguished Austrian gen. of Scottish descent; at an early age entered the Russian service, and fought in several battles against the Turks, retiring after the peace of Belgrade in 1739 with the rank of lieut.; in 1742 enlisted in the Austrian army, where he was rapidly promoted to the rank of capt., maj., and lieut.col. In the seven years' war against Frederick the great he so distinguished himself as to receive in a year the rank of maj.gen., and in three years became commander-in-chief. When peace was proclaimed in 1763 he received the title of baron, and in 1766 the honor of aulic councilor. In 1769 he became commandant-gen. of Moravia, and in 1778 field-marshall of the empire. In the war with the Turks he was victorious at Dubicza, Novi, and Grandisca. In 1789 he was made knight of the order of Maria Theresia.

LAUDONNIÈRE RENÉ GOULAIN DE, a French navigator of the 16th century. When the French admiral Coligny had secured a patent from Charles IX. to enable him to colonize the Protestants of France in America, he sent Laudonnière in 1562 to select a location and make a settlement. This was two years after Jean Ribault had built a fort and planted a small French colony at Beaufort in Port Royal bay, a remnant of which had returned to France. Laudonnière built a fort on the St. John's river named fort Caroline, where he established a colony. Difficulties with the Indians ensued; affairs were generally mismanaged; a band of the colonists were permitted to make a voyage of depredation against the Spaniards on the coast of Cuba. With the remnant of the colony he was about setting sail for France when Ribault, who had been appointed to supersede Laudonnière in the government of the colony, appeared Sept. 4, 1565, with a fleet of seven vessels. Almost simultaneously a Spanish fleet of five vessels, under Don Pedro Menendez de Aviles, appeared. In answer to the French challenge as to his purpose there, the Spaniard responded that he came with orders from his king to gibbet and behead all the Protestants in those regions. "The Frenchman who is a Catholic," he added, "I will spare. Every heretic shall die!" The French fleet, unprepared for battle, fled. The Spaniards, failing to overtake them, returned to the harbor of St. Augustine. The French fleet seems to have run to cover up the St. Johns under the walls of fort Caroline. Ribault, against the advice Laudonnière, decided to return with his fleet to attack the Spaniards at St. Augustine. He had reached the open sea when a storm arose and his squadron was wrecked near cape Canaveral, but the men, to the number of 500, were saved. Menendez then marched over land to the unprotected fort Caroline. Laudonnière, with but a handful of men, took refuge in the fort. It was quickly taken. The Spaniards executed Menendez's threat with their usual cruelty, murdering nearly the entire colony of 200 men, women, and children. Laudonnière, with a few men, escaped into the swamps near the fort and finally reached the coast. Meantime Ribault, ignorant of the tragedy at fort Caroline, conducted his men through swamps and everglades back to the settlement. The first body of 200 men, on reaching the fort, surrendered to Menendez and were slain. Ribault, with the second division of the force, fell into his hands soon after and they were also massacred; "not as Frenchmen, but as Lutherans," observes the discriminating murderer. Laudonnière, with the few others who had escaped, succeeded in reaching one of the vessels on the coast which was saved from the wreck of the fleet; and, returning to France, was driven on the English coast, where he remained till 1566. He seems to have been a man of little force, and made historical only by the colonial tragedy with which he was connected. In 1586 he published *L'Histoire Notable de la Floride, Contenant les trois Voyages faites en icelle par des Capitaines et des Pilotes François*.

LAUDS. See CANONICAL HOURS.

LAUENBURG, or SAXE-LAUENBURG, a duchy belonging to Prussia, but formerly united to the crown of Denmark. In the earlier half of the 13th c. it fell into the possession of the duke of Saxony, one of whose sons became the founder of the ducal house of Saxe-Lauenburg. After the extinction of this line, it was inherited by the duke of Brunswick-Celle in 1689, and passed into the possession of the Hanoverian kings of Great Britain, was seized along with Hanover by the French in 1803, and afterwards, with some changes of boundary, was made over to Prussia, and by Prussia transferred to Denmark, but with reservation of all rights and privileges. By the treaty of Gastein, 1865, it came into the possession of Prussia. It has an area of 400 sq.m., and (in 1875) 48,808 inhabitants, lies on the right bank of the Elbe, and borders with Hanover, Meck-

lenburg, Holstein, and the territories of Hamburg and Lübeck, and is a well-cultivated and fertile country. It is closely connected in political affairs with Holstein. The capital, Lauenburg, has only about 1100 inhabitants: the two largest towns are Ratzeburg (pop. 4,800) and Mölln (pop. 3,900).

LAUENBURG, a t. of Prussia, in the province of Pomerania, 38 m. w.n.w. from Dantzig. Manufactures of woolen and linen cloth, and of white and common leather, are carried on. Pop. '75, 7,192.

LAUGHING-GAS. See NITROGEN.

LAUGHTER—THE LUDICROUS. This familiar and peculiarly human expression has been the occasion of a good deal of discussion and controversy, being connected with a large and important class of effects, named the ludicrous, and also with wit and humor. We shall first advert to the physical part of the phenomenon, and then consider the mental causes or accompaniments of it.

Physically, laughter is a convulsive action of the diaphragm (q.v.). In this state, as remarked by sir Charles Bell, the person "draws a full breath, and throws it out in interrupted, short, and audible exclamations." This convulsion of the diaphragm is the principal part of the physical manifestations of laughter; but there are several accessories, especially the sharp vocal utterance arising from the violent tension of the larynx, and the expression of the features, this being a more intense form of the smile, the characteristic of pleasing emotions generally. In extreme cases, the eyes are moistened by the effusion from the lachrymal glands.

The causes of laughter are both *physical* and *mental*. Among physical causes, we must rank first hilarity, or animal spirits generally. When there is a great overflow of good spirits, it takes the form of the laugh among other violent manifestations. The rebound of robust natures from constraint or confinement, as when children are released from school, is marked with uproarious glee and excitement. Laughter is sometimes produced by the application of cold, as in the cold bath. Another notable form is the hysterical fit, where the explosiveness of the nervous system is an effect of disease, and followed by exhaustion.

The *mental* causes of laughter are what have given rise to the controversy. To determine the common characteristic of all those things termed "ludicrous," has been found a problem of no common difficulty. Various theories have been propounded, all with some truth, but perhaps none entirely explaining the facts. Aristotle lays it down that "the ridiculous implies something deformed, and consists in those smaller faults which are neither painful nor pernicious, but unbecoming—thus, a face excites laughter wherein there is deformity and distortion without pain." Here he touches upon several of the important conditions—viz., that there should be some strangeness or deviation from the ordinary appearances of nature, that this deviation should be on the side of degradation or inferiority, and that it should not be of a kind to excite any other strong emotion, as pity. Hobbes has given a theory to the effect that laughter is "a sudden glory, arising from a sudden conception of some eminency in ourselves by comparison with the infirmity of others, or with our own formerly." This evidently suits a certain number of cases, especially the laugh of ridicule, derision, and contempt. It would not be so easy to reconcile it with the humorous and genial laughter of those that are but little given to self-glorification or proud exultation over other men's discomfiture. Partly owing to this deficiency, and partly from the harsh judgment of human nature implied in it, this theory has been very unpopular. It has been contended, in opposition to Hobbes, that there are jests that do not imply the degradation of any living being; and that we often feel contempt for others, and sudden glory in ourselves by the comparison, without being urged to laughter. As to the first of these allegations, Campbell, in the *Philosophy of Rhetoric*, adduces the following instance: "Many," he says, "have laughed at the queerness of the comparison in these lines (from *Hudibras*):

For rhyme the rudder is of verses,
With which, like ships, they steer their courses,

who never dreamed that there was any person or party, practice or opinion, derided in them." But in addition to the agreeable surprise caused by the novelty of the comparison, which is the chief ingredient in wit, and may exist without any degradation of the subject, there is here a most apparent degradation of the poetic art, hallowed as it is in men's minds by the most dignified associations as something akin to divine inspiration, and now reduced to a vulgar mechanism of rhyme-making. Hobbes confines his definition too much to actual persons; for the laugh may be raised against classes, parties, systems, opinions, institutions, and even inanimate things supposed to be personified. It would not be easy to produce any unequivocal instance of a laugh raised without degrading some person or interest, while in a vast number of cases this circumstance is the indispensable and admitted condition of the effect.

Dr. Campbell himself, while challenging the theory of Hobbes, substitutes nothing in its place except an enumeration of the most prominent kinds of ludicrous effects. These are, first, the debasement of things great and eminent; secondly, the aggrandizement of little things by the language of splendor; and thirdly, the queerness or singularity of the imagery. Now, as regards the first of these, the debasement of things

eminently great—by far the largest class—the doctrine of Hobbes, if properly guarded, would be found fully applicable. There is a strong satisfaction in pulling anything down from a high pinnacle to plunge it in the mire, which we can interpret only as a mode of the sentiment of power, one of the most energetic and deep-seated passions of the human mind. This sentiment is gratified by every striking effect that we can produce ourselves; and few effects are more striking than to debase or humiliate some person or interest from a proud eminence; and not only so, but (what Hobbes neglected to remark) also by seeing the effect produced by the agency of some other person. A familiar mode of pandering to the sense of power is to put any one to flight; even the child can chuckle over this triumph of its young ability. Campbell's second class of cases might seem at first sight to be the opposite of the first, and thereby to contradict the general theory which that illustrates. But when mean and little things are aggrandized, by elevated phraseology, so as to raise a laugh, it will always be found that the effect is owing, not to the raising of the subject, but to the degrading of the language by connection with such a subject. This is the so-called *mock-heroic*, where the grand and the lofty in speech being employed upon the mean and insignificant, are debased to the level of what they are applied to. Such is the nature of *parody*. So that, in fact, Campbell's second species are merely a variety of the first. The third species, marked by "queerness and singularity of imagery," are really nondescript, but on analysis always yield more or less of the element of implied littleness or meanness in a subject usually held great or dignified.

In short, if we carefully set aside the element of the witty, we shall generally be able to explain the production of laughter upon a uniform principle. Every one would probably allow that nine cases out of every ten of the genuinely ludicrous are cases of the pleasure of degrading something, which furnishes a considerable presumption that the remainder are of the same general character, although perhaps enveloped with circumstances that disguise the fact. The figures of a powerful imagination, the resources of learning, and the polish of rhetorical art, may enter into a ludicrous combination. Such we have in the works of the great comic writers—in the plays of Aristophanes, Molière, and Shakespeare, and in the humor of Cervantes, Addison, Swift, and Sydney Smith—but wherever there is no expressed or implied degradation of some characters, classes, opinions, or institutions, we shall probably not experience the proper delight of the ludicrous.

LAUGIER, AUGUSTE ERNEST-PAUL, 1812-72; b. Paris; son of Stanislas, the surgeon; educated at the polytechnic school of Paris, and attached to the family of the astronomer Arago as a student of astronomy in the natural observatory of Paris. He was elected member of the academy of sciences in 1843, and was decorated in 1844. He has since been attached to the bureau of longitudes, and one of the examiners at the naval and marine school. He has published numerous astronomical works.

LAUMONTITE, called also **LAUMONITE**, and by Werner, efflorescing zeolite, because it crumbles easily after exposure to the air. It is one of the hydrous silicates, having the following average composition, which is from an analysis by Dufrénoy of a specimen from Phipsburg, Me.: silica, 51.98; alumina, 21.12; lime, 11.71; water, 15.5=99.86. It crystallizes in oblique rhomboidal prisms and in lamellar masses. Hardness, 3.5 to 4; sp. gr. 2.29 to 2.36. Vitreous, inclining to pearly upon the faces of cleavage. Color white, passing into yellowish gray, sometimes red; transparent, translucent, becoming opaque, and pulverulent on exposure. Before the blowpipe it fuses into a frothy mass. With borax it fuses into a transparent globule. It is gelatinous when treated with nitric or muriatic acid, but is not affected by sulphuric acid without heat. It is found in cavities in amygdaloid, porphyry, syenite, trap, gneiss, and sometimes in veins in clay slate. It was first found by Laumont in 1785 in lead-mines in Huelgoet, Brittany. Its principal localities are the Faroe islands, Greenland, Bohemia, Switzerland, Hartfield moss in Renfrewshire; amygdaloid rocks in Kilpatrick hills, near Glasgow; trap-rocks of Hebrides and north of Ireland; Peter's point, Nova Scotia, fine specimens associated with apophyllite and other hydrous silicates; Phipsburg, Me.; Charlestown quarries, Mass., in gneiss. It is abundant in the trap copper veins on lake Superior, and on the n. shore of lake Superior, between Pigeon bay and Fond du Lac; at Bergen hill, N. J., in greenstone with datholite and apophyllite; and at Columbia bridge near Philadelphia. The change which it ordinarily undergoes on exposure to the air may be prevented by dipping it in a thin solution of gum arabic which prevents the about 2 per cent loss of water.

LAUNAY, EMMANUEL LOUIS, HENRI DE. See ANTRAIGUES, *ante*.

LAUNCE, *Ammodytes*, a genus of fishes, of the eel tribe, with very elongated body, elongated head, large gill-openings, dorsal fin extending nearly the whole length of the back, anal fin also long, tail fin distinct from them both, and forked. Two species are common on the British coast, often called **SAND-EEL**, a name which, in some books of natural history, is restricted to the larger and less abundant of them (*A. tobianus*), a fish about a foot long, the *hornet* of the firth of Forth. The smaller species (*A. lancea*), about 5 or 6 in. long, is much used as bait by fishermen. Both are, however, very delicate and palatable. They are of a beautiful silvery color. The under jaw projects beyond the upper, and is used in burrowing in the sand, to which these fishes retreat

when the tide retires. They are obtained by digging in the sand, or by a kind of rake; or by nets drawn along the sand, when it is covered by the sea.

LAUNCESTON, a parliamentary and municipal borough of England, formerly the capital of the county of Cornwall, is situated on the Kensey, a tributary of the Tamar, 21 m. n.e. of Bodmin. It is a very old town; its castle was held of the Conqueror by the earls of Moreton. It unites with the borough of Newport in sending a member to the house of commons. The county assize formerly held here is now held at Bodmin. Pop. (1861) of municipal borough, 2,790; '71, 2,935.

LAUNCESTON, the second town of Tasmania, or Van Diemen's land, is to the n. of the island what Hobart Town, the capital, is to the s.—the chief port of entry and mart of trade. It stands at the junction of the Esk with the Tamar, which, after a course of 32 m., enters Bass's strait (q.v.) at port Dalrymple. It is accessible to ships of considerable burden, and carries on a thriving commerce with the colonies of Victoria and South Australia. Among the principal buildings are a church, a government house, a court-house, a jail, a college, a bank, and a barracks, and schools. Pop. '70, 10,668. Launceston has a well-patronized mechanics' institute, which possesses a library containing 6,000 volumes. There were, in 1879, a grammar-school, 33 private schools, and 3 public schools. The imports consist of manufactured goods, tea, sugar, etc. The chief articles of export are wool, oats, wheat, flour, timber, potatoes, horses, fruits. In the surrounding district of the same name rises Ben Lomond, to the height of 4,500 feet.

LAUNCH, the largest boat belonging to a ship. The launch has nearly superseded the long-boat, formerly the principal of a ship's boats. In modern ships of war, the launch is usually a small steamer, fully equipped, with capabilities for stowing several days' provisions. The launch of a man-of-war is frequently armed with a small piece of artillery in the bow; and when the ship is employed in narrow seas or rivers, it is not unusual for the launch to be dispatched on expeditions far from the ship, and to points which she is unable herself to reach.

LAUNCH is the process of removing a vessel from the land to the water. The keel of a ship is laid upon a series of wooden blocks, placed 6 or 7 ft. apart, and built up 3 or 4 ft. from the ground, the tops of which lie in a line which slopes downwards to the water at an angle of about five-eighths of an inch to the foot. The whole ship, therefore, when it is finished, slopes downwards with this inclination, and rests upon the blocks just mentioned, and upon suitable timber shores. When the vessel is ready for launching, "ways" of planking are laid down parallel to the keel, and at some little distance on each side of it, under the bilges of the ship; they extend into the water a considerable distance below high-water mark. A "cradle" is then built under the ship, of which the bottom is formed of smooth timbers resting upon the ways. Before launching, the under sides of these timbers and the upper sides of the ways are well greased, and the weight of the ship is transferred from the keel-blocks to the cradle and ways. Timbers, called "dog-shores," are placed so as to resist the tendency of the ship to slide down until the right moment. When this arrives, at high-water, the ceremony of naming the ship takes place; the dog-shores are knocked away, and the vessel glides stern foremost into the water. As soon as the water removes the weight of the vessel from the cradle, the latter breaks up into pieces.

The *Great Eastern*, owing to her immense length, was built with her keel parallel to the water; but owing to excessive friction, it took three months' exertion, even with the aid of powerful hydraulic rams, to push the immense mass of 12,000 tons into the river.

LA UNION, a t. in San Salvador, a division of Central America, situated on the w. bank of an inlet called La Union, part of the gulf of Conchagua or Fonseca, on the Pacific coast; pop. 3,000. The waters of the gulf partially separate San Salvador from Honduras. It is in the vicinity of 18 volcanoes, the loftiest of which is Conchagua, 70 m. e.s.e. of the town of San Salvador, and 30 m. w. of the port of Amapala, on the island of Tigre. It is a seaport of considerable importance, with a tonnage of 35,000 annually, an environment of exceptional beauty, but an extremely hot and unhealthy climate.

LAUNITZ, ROBERT EBERHARD, 1806-1870; b. Riga, Russia; studied sculpture under Thorwaldsen in Rome, and emigrated to New York, where he died. Among his works are the battle monument at Frankfort, Ky., the Pulaski monument at Savannah, and the monument to gen. George H. Thomas at Troy, N. Y.

LAURA, a name given to a collection of cells in a desert, differing from a monastery in which the monks all lived together. Each monk in the laura had his own cell, and for five days of the week lived alone, his only food being bread and water. On the other two days the monks all supped in common on broth, and took the sacrament. They were subject to severe rules. A meager diet, silence, and solitude were required. The origin of the name is unknown. The most celebrated lauras mentioned in ecclesiastical history were in Palestine, as the laura of St. Enthymus, 4 or 5 leagues from Jerusalem; the laura of St. Saba, near the brook Kedron; and the laura of the towers near the Jordan.

LAURA. See PETRARCA, *ante*.

LAURA'CEAE, a natural order of exogenous plants, consisting of trees or shrubs which have leaves without stipules, and flowers in panicles or umbels. The perianth is 4 to 6 cleft; the stamens opposite to its segments, and twice as many. The fruit is a one-seeded berry or drupe; the fruit-stalk often enlarging and becoming deshy.—This order contains about 450 known species, mostly tropical. The laurel (q.v.) is the only European species. An aromatic and fragrant character pervades the order, and amongst its products are cinnamon, cassia, and other aromatic barks, also a number of aromatic fruits somewhat resembling nutmeg. See *NUTMEG*. The timber of some species, as greenheart, is valuable; some are valuable for their medicinal barks, as greenheart (*bebeeri*) and sassafras; some for their secretions, of which camphor is the most important. *Oreodaphne opifera*, a South American tree, yields a camphoraceous volatile oil in great quantity, if mere incisions are made in its bark. The fruit of some species is agreeable, as the avocado pear (q.v.).—A few very remarkable species, forming the genus *casytha*, have been united with this order by many botanists, although others separate them as a distinct order. They are climbing parasites, like dodder, and inhabit the woods of the hottest parts of the globe.

LAUREATE, POET., is an officer of the household of the sovereigns of Great Britain. The appellation seems to have originated in a custom of the English universities of presenting a laurel wreath to graduates in rhetoric and versification: the new graduate being then styled *poeta laureatus*. The king's laureate was then simply a graduated rhetorician in the service of the king. R. Whittington, in 1512, seems to have been the last man who received a rhetorical degree at Oxford. The earliest mention of a poet-laureate in England occurs in the reign of Edward IV., when John Key received the appointment. In 1630 the first patent of the office seems to have been granted. The salary was fixed at £100 per annum, with a tierce of canary; which latter emolument was, under Southe's tenancy of the office, commuted into an annual payment of £27. It used to be the duty of the laureate to write an ode on the birthday of the sovereign, and sometimes on the occasion of a national victory; but this custom was happily abolished towards the conclusion of the reign of George III. The following poets have held the office of laureate since the year 1670: John Dryden, Nahum Tate, Nicholas Rowe, Laurence Eusden, Colley Cibber, William Whitehead, Thomas Warton, Henry James Pyle, Robert Southey, William Wordsworth—the office being at present held by Alfred Tennyson.

LAUREL, *Laurus*, a genus of *lauraceæ* (q.v.), which, as now restricted, contains only a single known species, the NOBLE L., VICTOR'S L., or SWEET BAY (*L. nobilis*), a native of Asia Minor, but now diffused over all the countries around the Mediterranean sea. It is often a mere bush of 15 ft. or less, but sometimes becomes a tree of 30, or even 60 ft. high. It has rather large, lanceolate, leathery, shining leaves, reticulated with veins, and axillary clusters of yellowish-white flowers of no beauty. The fruit is oval, bluish-black, and about half an inch long. Both the leaves and the fruit are bitter, astringent, and agreeably aromatic, and were formerly much used in medicine as a stomachic and stimulant, but are now almost out of use. The leaves, however, are still used in cookery for flavoring. They contain a volatile oil (*oil of sweet bay*), and a bitter, gummy extractive.

By the ancient Greeks, the laurel was called *daphne*; it was sacred to Apollo. Berry-bearing twigs of it were wound round the forehead of victorious heroes and poets; and in later times, the degree of doctor was conferred with this ceremony—whence the term *laureation*: and, according to some, the term *bachelor* (q.v.). And to this day, a laurel crown is the emblem of the honor to which poets, artists, and warriors aspire.

The noble laurel is common in shrubberies in Britain, but not nearly so common as the species of cherry laurel (q.v.), which share with it the name laurel, as do not a few other shrubs botanically very different, but somewhat similar in their evergreen foliage.

LAUREL, a co. in s.e. Kentucky, bounded by rivers on all sides but the e.: its western boundary being the Rock Castle river, and its northern and southern other affluents of the Cumberland: about 400 sq.m.: pop. '80, 9,131—9,121 of American birth. Its surface is undulating. It has fine grazing pastures, and extensive tracts of timber. Coal is found in the neighborhood of London. Its soil is fertile and yields average crops of grain and tobacco. Some attention is paid to the raising of stock, and it has a small trade in wool; other products are honey, flax, and sorghum. Seat of justice, London.

LAUREL HILL, a range in s.w. Pennsylvania, dividing the counties of Fayette and Somerset, farther n. those of Westmoreland and Somerset, and still farther n. separating Indiana and Cambria counties. In the s. the range extends over the border into West Virginia, and the chain is broken near that boundary by the Youghiogheny river and the Pittsburgh and Connellsville branch of the Baltimore and Ohio railroad, which crosses the counties of Somerset and Fayette, taking the same course as the river. It contains valuable deposits of bituminous coal easily mined. The chain is a ridge of the Alleghany mountains, passing through a section of country midway between the Connellsville coke region, and the coal district of Myersdale, where capital has been largely invested. Among the forest trees that adorn the mountain side and provide convenient lumber, are beech, elm, ash, hickory, white pine, oak, sugar maple, and wild cherry.

LAUREL RIDGE, in s.w. Pennsylvania, forming the southern portion of Chestnut Ridge, and, beginning at the Youghiogheny river, trends s.w. to the Cheat river in the s.w. extremity of Fayette co., where it rises 2,000 ft. above the level of the sea; thence into West Virginia through the counties of Monongalia, Marion, and Taylor, to the Monongahela river. It contains inexhaustible beds of bituminous coal, and is covered with evergreen and the usual forest trees, including the sugar maple and wild cherry.

LAUREL-WATER, is obtained by distilling a mixture of chopped and bruised leaves of the cherry-laurel and water, after 24 hours' maceration. It is seldom prescribed medicinally in this country, but may be given in doses of from half a dram to a dram as a sedative narcotic, in neuralgic pains, spasmodic cough, and palpitation of the heart; in short, in all the cases in which hydrocyanic is applicable. Death has occurred, with all the symptoms of hydrocyanic poisoning, from its incautious use as a flavoring ingredient in creams and puddings.

LAURENCE, RICHARD, D.C.L., 1760—1838; b. at Bath; graduated at Corpus Christi college, Oxford, in 1782. He entered the ministry of the church of England and preached the Bampton lectures in 1804, after which he became rector of Mersham, Kent. In 1814 he was appointed regius professor of Hebrew and canon of Christ church, Oxford. In 1822 he became archbishop of Cashel, and died in Dublin. It was largely through his influence that oriental studies, long neglected in England, were restored to their rightful place among scholars. It was also through his instrumentality that several interesting apocryphal works, often quoted by the Fathers, but supposed to be lost, were recovered from the Ethiopic manuscripts. Among these were the *Ascension of the Prophet Isaiah*, and the *Book of Enoch the Prophet*. He published a new version of *Fourth Esdras*, also from the Ethiopic; also *Dissertation on the Logos of St. John*; *Critical Reflections on the Unitarian Version of the New Testament*; *On the Existence of the Soul after Death*; and many occasional essays and sermons.

LAURENS, a co. in central Georgia, intersected by the navigable Oconee river, which flowing s. through the county forms its s.e. boundary; about 800 sq.m.; pop. '80, 10,051—10,039 of American birth, 4,352 colored. The Palmetto creek empties into the Oconee river in the central portion. The surface is generally level, and more than half covered with forests of oak, pine, and hickory. The soil has a foundation of limestone and clay, with an upper stratum of sandy loam containing elements of great fertility. Its staple products are wool, sweet potatoes, honey, sugar-cane, and live stock. It had in '70, 520 farms, 13 of 1000 acres and over. Seat of justice, Dublin.

LAURENS, a co. in n.w. South Carolina, has for its n. and n.e. boundary the Ennoree river emptying into the Broad river in the next county, and for its s. and s.w. the Saluda river, which, rising in the Blue Ridge mountains, and taking a south-easterly direction unites with the Broad river at Columbia; about 650 sq.m.; pop. '80, 29,444—29,365 of American birth, 17,666 colored. The Reedy river, an affluent of the Saluda, is mostly included in its limits. The Laurens branch of the Greenville and Columbia railroad terminates at Laurens Court-House. It has an uneven surface and a productive soil. Cash value of farms in '70, \$1,000,789. Value of all farm productions, including betterments and additions to stock in '70, \$1,469,545. Its staple products are barley, oats, corn, wheat, tobacco, cotton and wool, sweet-potatoes, honey, and sugar-cane. Granite is quarried, and among the industries are woolen factories and flour-mills. Seat of justice, Laurens Court-House.

LAURENS, HENRY, 1724—92; b. Charleston, S. C., descended from a family of Huguenots who fled to America after the revocation of the edict of Nantes. He was educated for a mercantile career in Charleston and London, and established a prosperous business, from which he retired rich, and traveled in Europe in 1771, placing his children in England to be educated. His experience of differences with the crown judges on matters of marine law turned his attention at an early period to the exercise of arbitrary power as practiced by the mother country in her relations with the colonies, and of which he became a bitter opponent. Early in 1774 parliament passed the Boston port bill, which closed that port to all commerce, and transferred its privileges to Marblehead and Salem. Laurens was one of about 40 Americans who petitioned parliament against the passage of this bill, most of the petitioners being South Carolinians. This occurred while he was still abroad, and on the petition proving unsuccessful, he returned to Charleston, and identified himself with the patriot cause. He was president of the council of safety, and president of the continental congress. In 1779 he was sent to Holland, charged with the negotiation of a commercial treaty, but fell into the hands of the British, and being taken to London, was imprisoned in the Tower during 15 months, which completely broke his health. Congress appointed him in 1781 one of the peace commissioners, and on Nov. 30, 1782, he signed the preliminary treaty in Paris, in company with Jay and Franklin. During the latter years of his life he declined all connection with public affairs, on account of his health, and devoted himself to agricultural pursuits. He left an injunction in his will that his remains should be cremated, which was complied with by his heirs. The collections of the South Carolina historical society contain his historical papers, which were collected after his decease.

LAURENS, JOHN, 1753-82; son of Henry, having been liberally educated in England, returned to his home in South Carolina, and in 1777 entered the patriot army, being appointed aide to gen. Washington. In this position many of the duties of a private secretary fell to his lot, and his familiarity with foreign languages enabled him to be of great service in conducting the necessary correspondence constantly occurring with European officers in the service. His military career was distinguished by dauntless bravery, and his conduct at the battles of Brandywine, Germantown, Coosawhatchie, and during the siege of Charleston, was highly commended. Early in 1781 he was sent by Washington on a special mission of appeal to the king of France for aid to the colonies, and succeeded in accomplishing his purpose. At Yorktown it fell to his duty to receive the sword of the commander, Oct. 19, 1781. During the remainder of the war he was with gen. Greene, and having exposed himself during a skirmish on the Combahee river, met with his death, his loss being lamented as among the most serious of the revolution. It is on record that Washington felt keenly the death of one who had been a valuable confidential assistant and a faithful and self-sacrificing friend to him during the many exigencies and dangers of the war. At the battle of Monmouth his intrepidity relieved Washington from imminent peril. He challenged gen. Charles Lee and wounded him in the duel which followed, the cause of his action being a disrespectful reference to Washington on the part of Lee, in the course of his attempt to explain his misconduct at Monmouth. The army correspondence of Laurens was privately printed in 1867 among the publications of the Bradford club (N. Y.). When it is remembered that Laurens was only 29 years of age at his death, it will be recognized that his career was in the highest degree honorable, patriotic, and unselfish.

LAURENTIAN SYSTEM, a series of highly metamorphosed rocks, older than the Cambrian, and apparently the fundamental series of the stratified rocks. They have been so named from their covering the whole country n. of the St. Lawrence, where they were originally described by sir William Logan. They consist of hornblendic and micaeuous gneiss, alternating with or passing into mica-schist, the whole being considered to have been originally sedimentary deposits, and to have been thus altered by long-continued metamorphic action. A few large, irregular beds of crystalline limestones, and bed-like masses of magnetic oxide of iron and other minerals, are interstratified with the gneiss. True igneous rocks are frequently intruded among these strata, as veins and masses of granite, syenite, and greenstone. The beds are highly inclined and greatly contorted, so that no approximate estimate can be made of their thickness, which seems to be very great. Murchison and Geikie have lately determined that certain great masses of highly crystalline gneiss, which underlie the Cambrian series in the n. of Scotland, belong to this period. It is probable that some of the highly metamorphosed rocks of the n. of Ireland may be of the same age.

LAURENTIAN SYSTEM (ante). It may be more precisely stated that the Laurentian system of rocks is the lower period of the *eozoic* age, or as it is termed by prof. J. D. Dana, the *archæan* (q.v.), that is, the age of the first appearance of organic life. This archæan age is divided into two periods, the Laurentian beneath and the Huronian above, sometimes called *upper* and *lower* Laurentian. The Huronian lies immediately beneath the Cambrian system or age of Sedgwick. The Laurentian rocks proper, or lower Laurentian, are composed chiefly of primitive gneiss, and have been subjected to more change (metamorphism) than any other rocks, unless it be a fact that granite, now called primary, is really derived from stratified rock by igneous action. The Huronian or upper Laurentian rocks are, to a considerable extent, crystalline schists, much less compact than the (lower) Laurentian gneiss, whose strata are also much more convoluted than those of the Huronian. Both together form a series of rocks which in Canada have a thickness of 40,000 ft., passing into gneiss and granite downwards, and upwards into hornblende gneiss, syenites, diorites, and limestones, the latter being metamorphosed into marbles.

The immense beds of iron ore in the Laurentian rocks are considered as evidence of abundant organic life during that age (see METAMORPHIC ROCKS, *ante*), as also are the great beds of graphite (q.v.). In addition to these evidences, there have been found in the Laurentian limestones of Canada, Bohemia, and other countries, large, irregular, cellular masses, which are regarded as the remains of gigantic rhizopods, and the supposed species has been called *eozoön Canadense* (q.v.).

LAURENTIUS, SAINT. See LAWRENCE, SAINT, *ante*.

LAURENTUM, a t. in ancient Italy, the capital of Latium, about 16 m. below Ostia. It was a maritime city of importance, and its name appeared in the first treaties between Rome and Carthage, as is recorded in Polybius. After the defeat of the Latin league at lake Regillus, it fell into decay, and was deserted and left in ruins. It was, however, subsequently restored, and a new city formed by the union of Laurentum and Lavinium, which was known as Lauro-Lavinium. The ancient city was renowned for its groves of laurel, and was frequented by the Roman nobles in winter as a place of fashionable suburban resort. Hither the emperor Commodus was ordered by his physician; Scipio and Lælius are said to have gone thither frequently for recreation after the cares of business; and Pliny the younger describes with minuteness his beautiful villa at Laurentum.

Hortensius, the orator, the rival of Cicero, was also one of those who possessed villas in that neighborhood.

LAURIA, a t. of Italy, in the province of Potenza, 98 m. s.e. by e. from Naples, and about 5 m. from the shore of the gulf of Policastro. Opposite to it is the imposing mass of Monte Sirino. Lauria is an ancient town, but still of considerable prosperity. Woolen manufactures are carried on. It consists of two parts—upper and lower Lauria. Their united pop. in 1872 was 10,696.

LAURIC ACID, also called LAUROSTEARIC, and PICHURIC ACID, a fatty acid first described by Marsson in 1842. It occurs as a glyceride, laurostearine, in the fat of the bay tree, and in the solid fat and volatile oil of pichurim beans. It also occurs in connection with myristic acid in *myrica cerifera*, and other plants. It also exists in connection with other fatty acids or their glycerides in spermaceti, and in cocoanut oil. It is separated from the mixtures of fatty acids by saponifying them with caustic alkaline solutions, and decomposing the soaps thus formed by hydrochloric or tartaric acids. Lauric acid is insoluble in water, but is readily soluble in alcohol and ether, and crystallizes from the alcoholic solution in white, silky needles, or translucent scales which melt at about 109.4° Fahr. The laurates of the alkali metals and of barium are soluble in water. The other salts are insoluble, or sparingly so. The calcium salt is decomposed by distillation into carbonate of lime and laurostearone, $\text{Ca}_2\text{C}_{12}\text{H}_{22}\text{O}_2 = \text{CaO} + \text{CO}_2 + \text{C}_{23}\text{H}_{46}\text{O}$.

LAURISTON, JACQUES ALEXANDRE BERNARD LAW, Marquis de, 1768-1828; b. India; was educated with Napoleon I. at a military school in Paris. He was a descendant of the brother of the celebrated John Law of Lauriston, the author of the "Mississippi scheme." Entering the French army while quite young, he was befriended by Napoleon, who made him his aid-de-camp, and aided him to rise in his profession. He was employed in the conduct of many important missions, and exhibited much skill as a diplomatist. He was also a brave and successful commander, was engaged in every campaign of the French armies in Germany, Spain, and Russia, and decided the victory of Wagram at a most critical moment. The Austrians were holding an advantageous position; the left wing of the French under Massena had been driven back with great fury; the right wing under Davoust was being severely pressed, and hardly maintaining its ground; when Lauriston, at the head of 100 pieces of artillery, came up at full trot and attacked the enemy's center, producing a diversion which resulted in victory. At the conclusion of peace, he received the grand cordon of the legion of honor from Louis XVIII. In 1817 he was created a marquis, and four years later was made a marshal of France.

LAURIUM, a promontory in s.e. Attica, a division of Greece, bordering on the Ægean sea, celebrated for its mines of silver, zinc, and antimony, which in the time of Herodotus yielded a considerable profit to the Athenians who shared it. According to Xenophon, they were worked by shafts and drifting with the use of imported timber; pillars of the ore being left to support the mountain. It is mentioned that a particularly noxious vapor rose from the mines. In Strabo's time they had begun to extract silver from the old scoriae, which floated upon the surface of the metal when fused, and which has been used in the harbors for various building purposes. The same process of procuring silver is being carried on at the present day, and the scoriae yield 10 per cent of argentiferous lead. In 1863 a Marseilles company reopened the mines, and in 1871-72 they were a subject of controversy in France and Italy with the Greek government, which was settled in 1873, and they are now worked by a company belonging to their own government. It is a lofty and steep hill crowned by a thick growth of pine trees. Marble is found in large quantities, and the country abounds in lead ore.

LAURUSTINUS, *Viburnum Tinus*, see VIBURNUM; a shrub very frequent in pleasure-grounds in Britain, a native of the s. of Europe and the n. of Africa. It is a beautiful evergreen, with dark, shining, leathery leaves, small whitish flowers in corymbs, and small blackish-blue berries. The flowers appear in winter or very early spring. The berries have drastic purgative properties; they are very acrid, and inflame the mouth violently, yet some kinds of birds eat them with avidity. The laurustinus cannot endure much frost; and in Germany and the northern parts of the United States it is a greenhouse plant.

LAURVIG, a seaport t. of Norway, situated at the head of a small fiord, which branches off from Christiania fiord. The town of Laurvig has of late rapidly increased in population and prosperity. It carries on a considerable trade with foreign countries, and particularly with Britain. Very extensive iron-works—the Fritzøe iron-works—are situated near the town. A cannon-foundry gives employment to many operatives. There are also snuff-manufactories and distilleries. The harbor is excellent, and suitable for the largest vessels. Pop. 4,944.

LAUSANNE' (Lat. *Lorsana*), a city of Switzerland, capital of the canton of Vaud, is picturesquely situated on the southern slope of the Jura mountains, close to the northern shore of the lake of Geneva, on which the village of Ouchy forms its harbor. The two principal parts of the city are separated by a valley, across which a fine bridge has been recently thrown. Lausanne has a number of religious, educational, and scientific insti-

tutions. The cathedral, a beautiful Gothic building, begun in the 10th c., and completed in the 13th, is the greatest ornament of the city. Lausanne is much frequented by visitors from all parts of the world. Hére Gibbon resided for many years, and the house in which he wrote the greater part of the *Decline and Fall* is still shown. John Kemble, the actor, is buried in a cemetery in the vicinity. Brewing, lithographing, and cotton and wool spinning are the principal branches of trade. The pop. in 1870 was 26,520.

LAUZUN, ANTONIN NOMPAR DE CAUMONT, Duc de, 1633-1743; b. France; a notorious adventurer and a favorite for a time of Louis XIV. Born a poor nobleman in Gascony, he possessed all the peculiar Gascon traits of energy, shrewdness, unbounded effrontery, and recklessness. He was courtly in his manners, witty, and attractive to the fair sex. His exploits and adventures were romantic; though many of them, resting on no broader foundation of testimony than his own word, have been judged apocryphal by historians on the ground of the boastful and mendacious character of their alleged hero. Appointed by the king governor of Berri, and mareschal de camp, and promised the grade of grand master of artillery, Lauzun was sufficiently indiscreet to boast of the favors of Louis, a course which speedily placed him in disgrace. He was committed to the Bastile by order of the king, but the latter soon repented his severity, and Lauzun was restored to favor, being even promised the hand in marriage of Mlle. de Montpensier, granddaughter of Henry IV. This marriage was prevented, however, by court intrigues; and to reconcile him to the disappointment the king made Lauzun commander of the French army in Flanders. It has been asserted by some contemporary writers that this marriage was actually though secretly effected. Lauzun was at length so unfortunate as to offend Mme. de Montespan, at the time all-powerful with the king, and, through her influence, he was again cast into prison, and this time to remain for several years. He finally gained his liberty, as is stated, through the intercession of Mlle. de Montpensier; and, repairing to England in 1688, was commissioned by James II. to escort the queen and her infant son to France on the outbreak of the revolution. Lauzun, in 1695, at the age of 62, married Mlle. de Durford, a girl of 16 years, Mlle. de Montpensier having died two years before.

LAUZUN, ARMAND LOUIS DE GONTAUT, Duc de, 1747-93; b. Paris; commanded a naval expedition against England in 1779, and took part in the American war, 1780-83. He succeeded to the title of duc de Biron, was a deputy to the states-general, and a confidant and secret agent of the duke of Orleans. He was general-in-chief of the army of the Rhine in 1792, and of the army of La Rochelle in 1793. After taking Saumur and defeating the Vendéans at Parthenay, he resigned; but being accused before the committee of public safety of having been too lenient in his treatment of the Vendéans, he was deposed, imprisoned, tried before the revolutionary tribunal for conspiracy, condemned Dec. 31, 1793, and executed the same day. His ability was undoubted, but he was dissolute and unscrupulous.

LAVA, a name sometimes applied generally to volcanic rocks (q.v.), but more strictly confined to those rocks which have been poured out as a stream of molten matter from a volcanic opening, either on dry land or in shallow water. The surface of the stream, which speedily cools and hardens, is generally quite porous and vesicular, from the escape of the confined gases; but as rock is always a bad conductor of heat, the interior often remains long in a liquid condition, permitting the continued flow of the stream sometimes to a very great distance from the orifice from which it has been discharged, notwithstanding its indurated covering. The end of the stream is a slowly-moving mass of loose porous blocks, rolling and tumbling over each other with a loud rattling noise, being pushed forward in fits and starts by the viscous lava, when it bursts the hardened crust and rushes on. The structure of the interior of a solid lava-stream shows a compact and homogeneous rock, assuming a more and more crystalline structure as the cooling has been the work of a longer or shorter period of time. Caverns are sometimes formed in lava-streams by the escape of the molten mass below, leaving the cooled crust standing like the roof of a tunnel.

LAVA BEDS. See MODOCs.

LAVACA, a co. in s.e. Texas, watered by numerous little streams, and the Lavaca and Navidad rivers emptying into Lavaca bay and thence into the gulf of Mexico; about 970 sq.m.; pop. '80, 13,642—12,038 of American birth, 3,426 colored. It is divided into fertile prairies and small tracts of timber land. The soil is adapted to the production of cotton, rice, corn, tobacco, wool, sweet potatoes, and sorghum. Good building timber of ash and oak is found in the groves. The product of its orchards is among the finest in that region, and beef is exported, canned and in bulk. Number of farms in 1870, 905; over 1000 acres, 1. Cash value of farms in 1870, \$1,025.101. The Galveston, Harrisburg and San Antonio railroad crosses the extreme northern section. Seat of justice, Hallettsville.

LAVAL, an ancient and picturesque t. of France, capital of the department of Mayenne, is situated on the river Mayenne, 42 m. e. of Rennes. Its chief building is an old château, now a prison, and formerly the residence of the dukes of La Tremouille. For 500 years this town has been celebrated for its linen manufactures, which are exported from, as well as sold throughout, France. Cottons, calicoes, serge, soap, and leather

are also manufactured, and there is a considerable trade in grain, wool, timber, and iron. In the vicinity of Laval the Vendees under Larochejaquin gained a brilliant victory over the republicans, who lost 12,000 men and 19 cannon in the engagement. Pop. '76, 25 110

LAVAL, a co. of the province of Quebec, Canada; pop. 9,472. It consists exclusively of the isle Jésus, 23 m. long and 6 m. broad, lying between the Ottawa river and the Rivière des Prairies.

LA VALETTA. See VALETTA, LA.

LA VALLIÈRE, FRANÇOISE LOUISE DE LABAUME LEBLANC DE, a celebrated mistress of Louis XIV. of France, was b. at Tours, in 1644, of an ancient and noble family. At an early age she lost her father, and was brought to court by her mother, who had married a second time. She was not a great beauty, and had a slight lameness; but her amiability and winning manners, and, above all, the extraordinary sweetness and tenderness expressed in her looks, rendered her very attractive. It is seldom that one can do more than praise the face of a king's mistress, but this singular creature was characterized by an extreme, we might almost say a morbid, delicacy and modesty. She really loved Louis, and bore him four children, of whom two died in infancy; but although she and they received wealth and titles of honor, she remained always extremely sensible of the disgrace of their birth. When Madame de Montespan became the royal favorite she retired into a Carmelite nunnery in Paris, where she took the veil in 1674. She died June 6, 1710, after having spent more than 30 years in penances and religious austerities. She wrote a work entitled *Réflexions sur la Miséricorde de Dieu* (Paris, 1680), of which a copy, dated 1688, with corrections by Bossuet, was discovered in the Louvre in 1852. Both have been edited by M. Romaine Cornut (Paris, 1854). A collection of her letters was published in 1767.

LAVAL-MONTMORENCY, FRANÇOIS XAVIER DE, 1622-1708; was made a priest at the age of 23 years, and 6 years later was named missionary-bishop of Cochin-China. He declined the office, however, and in 1653 was appointed arch-deacon of Evreux. In 1659 he was sent to Canada, bearing the titles of vicar-apostolic of New France and bishop of Peträa in partibus, that he might successfully enforce his authority in that country, where the archbishop of Rouen was arrogating supremacy to himself. He established the seminary of Quebec, under letters-patent of Louis XIV., and being actually the civil as well as ecclesiastical ruler, directed social conduct in the interest of propriety and morals, particularly enforcing the most stringent enactments in favor of temperance and against the sale of intoxicating liquors to Indians, which was at this period a crying evil. In 1674 he became titular bishop of Quebec, an office which he held until 1688, when he resigned it and devoted himself thereafter to the conduct of the affairs of the seminary. His religious enthusiasm, his force of character, and his unblemished life made him universally respected, and his name is remembered in Quebec in the Laval university, formerly the seminary to which he devoted a great part of his life and property, and which in 1854 was raised by the queen of England to its present grade.

LAVA ORNAMENTS, the name given to trinkets, charms, and other small articles manufactured from volcanic slag, or lava, which is melted up and applied to such designs and purposes as are favorable to the use of the material.

LAVATER, JOHANN KASPAR, b. Nov. 15, 1741, at Zürich, was the son of a physician. As a boy he was by no means distinguished for his talents; but in 1762, whilst yet a youth, he gave a signal proof of his energy and courage in coming forward, along with Henry Fuseli, to accuse the *landvoigt* Grebel of oppression and injustice, under which others had groaned without daring to complain. He early gained a high reputation by a volume of poems, entitled *Schweizerlieder* (Bern, 1767). His next publication was *Aussichten in die Ewigkeit* (3 vols. Zür. 1768-73), of which several editions were soon called for. The tone of this work is that of high religious enthusiasm, mingled with asceticism. He filled in succession several ecclesiastical offices in his native city, and finally, in 1786, became minister of the church of St. Peter there. His powers of observation were very keen, and his discrimination of character most delicate, and believing that he could discover much of men's characters from their countenances, he concluded that physiognomy might come to be reckoned among the sciences. He labored, therefore, to form a system of physiognomy, hoping thus to promote greatly the welfare of mankind, and at last he published the work to which he owes the chief part of his celebrity, *Physiognomische Fragmente zur Beförderung der Menschenkenntniss und Menschenliebe* (4 vols. Leip. and Winterth. 1775-78). This work, which has often been reprinted and translated, is written in an inflated style. It gave rise to much discussion, and occasioned not a little display of wit and humor. Lavater himself appears latterly to have been convinced that his system was fanciful. But he was of a highly imaginative temperament, and the religious orthodoxy which he firmly retained was incongruously combined with novel speculations and with superstitious notions. He was the chosen spiritual adviser of many persons both in Switzerland and Germany, with whom he maintained an unwearied correspondence. On his tours in Germany he received extraordinary marks of popular esteem and honor. When the French revolution began,

Lavater hailed it with joy; but after the murder of the king he regarded it with religious abhorrence. In performing kind offices to some wounded persons on the street at the capture of Zürich by Massena, Sept. 26, 1799, he received a wound, of the effects of which he died, after long suffering, Jan. 2, 1801.

LAVAUR, a t. of France, in the department of Tarn, is situated on the left bank of the Agout, 20 m. n.e. of Toulouse. Its manufactures are cotton-yarn, leather, and silk. Pop. '76, 4,937.

LAVELEYE, ÉMILE LOUIS VICTOR DE, b. Bruges, 1822; a Belgian writer, politician, and author of historical studies connected with political economy. His studies were completed in Paris. In 1848 he was a frequent contributor to French reviews, and a defender of the revolutionary liberalism of that year. In 1858 he became one of the editors of the *Revue de Deux-Mondes*, enriching it with articles of remarkable ability. He was subsequently made professor of political economy in the university of Liege; a member of the international jury at Paris in 1867; and a corresponding member of the academy of moral and political sciences of Paris. The list of his published works indicates a wide range of studies. The last, *Essai sur les Formes de Gouvernement dans les Sociétés Modernes*, 1872, is one of the most notable.

LAVENDER, *Lavandula*, a genus of plants of the natural order *labiateæ*, having the stamens and style included within the tube of the corolla, the corolla two-lipped, the upper lip bifid, the lower trifid.—The COMMON LAVENDER, or NARROW-LEAVED LAVENDER (*L. vera* or *L. angustifolia*), grows wild on stony mountains and hills in the s. of Europe, and in more northern regions is very generally cultivated in gardens. It has a delightful aromatic fragrance, and an aromatic bitter taste, and contains a great quantity of a volatile oil, *oil of lavender*. The whole plant possesses stimulant properties, and is used in medicine, but particularly the spikes of the flowers, as a tonic, stomachic, nervous stimulant, etc. Lavender flowers are often put into wardrobes to keep away moths. They are much used in perfumery. *Oil of lavender* is procured by distillation of lavender flowers with water. It requires 70 lbs. of flowers to yield 1 lb. of oil. It is rather lighter than water, pale yellow, very fluid, and very fragrant. *Spirit of lavender* is made by distilling lavender flowers with rectified spirit; *lavender water*, one of the most popular of all perfumes, by dissolving oil of lavender with smaller quantities of other volatile oils in rectified spirit. Lavender is extensively cultivated for its flowers in some places near London, and particularly at Mitcham in Surrey, where more than 200 acres are occupied by it, the light and sandy soil being especially suitable to it.—BROAD-LEAVED LAVENDER (*L. latifolia* or *L. spica*) is also a native of the s. of Europe, but is more tender than common lavender. It is also less fragrant, and the oil which it yields is called *oil of spike*, and sometimes *foreign oil of lavender*. This oil is used by painters on porcelain, and in the preparation of varnishes.

LAVER, a name given to a number of kinds of sea-weed, which are used as food, especially *porphyra vulgaris* and *P. laciniata*, of the sub-order *confervaceæ*, and nearly allied to the genus *ulva*. These plants grow on rocks and stones in the sea, and are not unfrequent on the British shores. They consist of a very thin flat purple frond, which is not gelatinous. The frond of *P. vulgaris* is wavy and undivided, that of *P. laciniata* (sometimes called SLOKE) is deeply cleft, and has the segments lobed and cut at the edges. Laver is stewed and brought to table as a luxury; also pickled and eaten with pepper, vinegar, and oil, or with lemon juice. It is regarded as useful in scrofulous affections and glandular tumors, a property which it probably owes to the iodine which it contains.—The name of GREEN LAVER is given to *ulva latissima*, a common sea-weed of the British shores, the frond of which is green, membranous, broad, flat, wavy, and sometimes inflated. It is bitterish, but is often used in the same way as the true laver, and possesses similar properties.

LA VILLEMARQUÉ, THÉODORE-CLAUDE-HENRI HERSART, Vicomte de, a Breton antiquary and Celtic scholar, was b. at Quimperlé, in Bretagne, on July 6, 1815. Representing an old family of his native province, his attention was early turned to its antiquities and its peculiar language and literature. His first important work was a collection of popular Breton songs and melodies, published in 1839, with a French translation and notes, under the title of *Barzaz-Breiz*. Three years afterwards appeared his *Popular Tales of Bretagne*, to which was prefixed a dissertation on the story of the Round Table. His next work was a collection of the poems of the Celtic bards of the 6th c., with a French translation, and explanatory and critical notes (1850). This publication made the labors of La Villemarqué widely known. He was appointed a correspondent of the academy of Berlin, and a member of the French institute (academy of inscriptions and belles-lettres). La Villemarqué has since published a work entitled the Celtic Legends (*La Legende Celtique*) of Ireland, Cambria, and Bretagne, which contain such of the original texts—Irish, Welsh, or Breton—as are rare or unpublished. La Villemarqué is the author or editor of several other works connected with the Celtic literature and languages, among which are a *Breton Grammar*; a *Breton and French Dictionary*; *Bretagne Ancient and Modern*; and *The Great Mystery of Jesus*; with a dissertation on the dramatic literature of the Celts.

LAVINIUM, an ancient city of Latium, 17 m. s. of Rome, founded by Aeneas and named in honor of his wife Lavinia. It was between Laurentum and Ardea. In the time of Trajan it united with Laurentum under the name of Lauro-Lavinium, and for a few years was important as the capital of Latium and as the religious center of the Latin cities in opposition to the claims of Alba, but held its political importance for no long period. It is now called *Pratica*.

LAVISH PERSONS. See INTERDICTION.

LAVOISIER, ANTOINE LAURENT, the founder of the antiphlogistic or modern chemistry, was b. in Paris, Aug., 1743, and devoted himself to scientific, and particularly to chemical studies, to obtain the means of more fully prosecuting which he accepted in 1769 the office of farmer-general. In 1768 he was made an academician; in 1776, discovered a way of greatly improving the quality of gunpowder; and made other beneficial discoveries in economics, and in the application of chemistry to agriculture. Availing himself of the discoveries of Black, Priestley, and Cavendish, and making many experiments and discoveries himself, he was led to connect the recently discovered gas, oxygen, with the phenomena of combustion and of acidity; and in 1783 he proved that water can be formed by burning oxygen and hydrogen together, and that it can be decomposed into the same elements. He and his associates invented a new chemical nomenclature, adapted to the advanced state of the science, which was very generally adopted. See CHEMISTRY and CHEMICAL NOMENCLATURE. Lavoisier's services to science could not save him from the popular rage against farmers of the taxes during the reign of terror, and he died by the guillotine, 1794. His principal work is his *Traité Élémentaire de Chimie*; but of course his chemical works are now interesting merely as marking the history of the science.

LAVOISIER, ANTOINE LAURENT (*ante*), the son of a rich merchant, had the advantages of a very liberal early training. He studied astronomy with La Caille, chemistry with Rouelle, and was a pupil of the celebrated botanist Jussieu. At the age of 23 he won the prize of the academy of sciences by his *Mémoire sur la Meilleure Manière d'éclairer les Rues d'une Grande Ville*. This, and his *Mémoire sur les Conches des Montagnes* procured his admission to the academy of sciences. He was elected in 1787 to the provincial assembly of Orleans. He was appointed one of the trustees of the bank of discount in 1788, and made an admirable report upon the condition of that institution in 1789, as assistant deputy of the constituent assembly. In 1790, as a member of the commission on weights and measures, he was active in the preparation of the new decimal system. In 1791, as one of the commissioners of the treasury, he published his essay *De la Réchasse Nationale de la France*, a paper which made him take rank as one of the first political economists of the age. But chemistry was the absorbing subject of his life, and he pursued it for nearly a quarter of a century, living only to the age of 51. He wrote many essays and memoirs, but his greatest work is his *Traité Élémentaire de Chimie* (2 vols. 8vo, 1789). It is to Lavoisier that chemistry owes its first well-founded scientific steps. His adoption of the method of weighing chemical constituents led to the overthrow of the phlogiston theory, which was one of the great stumbling-blocks in the way of advancement. The increase in weight of a metal when oxidized had, indeed, been known by Stahl, but it had been attributed to other causes than that of combination with oxygen. It is a remarkable fact that the discoverer of oxygen, Priestley, was the last adherent of the phlogiston theory, while his discovered element was one of the most potent arguments against this theory in the hands of Lavoisier. The discovery by Cavendish that hydrogen when burned forms water furnished Lavoisier with an explanation of the solution of metals in acids. He saw at once that water was in this operation decomposed, the hydrogen being liberated, but the oxygen, the other element, uniting with the element to form an oxide. One of Lavoisier's most important works was, in conjunction with Guyton de Morveau, Berthollet, and Fourcroy, to devise a system of chemical nomenclature, a work which was commenced by Guyton de Morveau.

LAW, in theology, a term variously used. In the Bible it often includes the whole of revelation, doctrinal as well as preceptive; but it is often also used, in a more restricted and somewhat conventional sense, to signify the books of Moses, the whole Jewish Scriptures being comprehended under the twofold designation of "the law and the prophets." A very natural and common use of the term law is to denote the preceptive part of revelation, in contradistinction to the doctrinal, the one being designated as *the law*, and the other as *the gospel*. When employed in Scripture with exclusive reference to the preceptive part of revelation, the term law sometimes signifies the Jewish code of precepts as to rites and ceremonies, called by theologians the CEREMONIAL LAW, and which is regarded as having been abrogated when the Jewish dispensation gave place to the Christian. The ceremonial law is also regarded as having in its rites and ceremonies—"a shadow of good things to come"—symbolized the great doctrines which form the system of Christianity.—The MORAL LAW is that preceptive revelation of the divine will which is of perpetual and universal obligation. It is commonly regarded by theologians as summed up in the *Ten Commandments*; and, according to our Savior's own statement, as still more briefly and comprehensively summed up in the two commandments of loving God with all our heart, and soul, and strength, and mind, and loving our neighbors as ourselves. Although the Ten Commandments were given to the

Jews at Mount Sinai, it is not therefore held that they were intended for the Jews alone, or were then first promulgated; the moral law being regarded as really the *law of nature*, written on the heart of man at his creation, although to fallen man a clear and express revelation of it has become necessary. One of the chief contested points in connection with this subject is that of the Sabbath (q.v.). Another relates to the law of nature, and the value which ought to be practically assigned to the decisions of the judgment and conscience of man, apart from express revelation.—The obligation of the moral law on the consciences of Christians is admitted by all except Antinomians (q.v.).

LAW has been variously defined. Blackstone says it means the rules of human action or conduct. This definition is too wide, for it is confined only to such rules as courts, supported by proper authority, will enforce. The law of nature consists of those laws which are common to all mankind, and are supposed to be, as nearly as can be conjectured, independent of the accidents of time and place. The civil or municipal law of a nation is what is commonly understood by the term law, when applied to a particular country. The "civil law" is also sometimes used *par excellence* to denote the old Roman law as embodied in the *Institutes* of Justinian, the code, and other parts of what is commonly called the *Corpus Juris Civilis*. Many of the leading doctrines of that law have been adopted by modern nations. England is the civilized country which has adopted the least from that code of law, while Scotland follows the continental nations in adopting the Roman or civil law to a large extent, and on many subjects in adopting it entirely. The law of nations is subdivided into public international law (q.v.) and private international law, or the *comitus gentium*. Law is often used in England as contradistinguished from equity, but this is chiefly due to the accidental circumstance that there is a subdivision of courts into courts of law and equity, according to the nature of the remedy given. See JURISPRUDENCE, INTERNATIONAL LAW, CHANCERY. Law is also often in popular parlance distinguished from justice, the latter being supposed to be perfect in its nature, or as near the standard of perfection as can be supposed; whereas there are numberless cases of injury, hardship, and oppression which, owing to human infirmity, no system of human laws can adequately redress; and this is often adduced as confirmation of the doctrine of future rewards and punishments. Law is also sometimes subdivided into criminal law, constitutional law, etc., according to the particular subject-matter.

LAW (ante). This is a word in extensive use in regard to divine and human law, as well as to that which has received the name of natural law. There are differences of opinion as to what should always be considered divine law, and volumes have been written embracing subjects related to it, as well as those which relate to human laws, in connection with the question of the validity, and therefore the reality, of human laws unless founded upon divine law. The origin of the word law is Anglo-Saxon, *lag*, from *legan*, to lay, and signifies to found, to lay down, to establish, or to ordain. Therefore there are philosophers who maintain that laws, strictly considered, are those only which have been laid down, or that they are commands relating to rules of action, and that they must proceed from authority. They maintain that it is not sufficient that there should be uniformity of phenomena for such uniformity to be called by the name of law; consequently the ordinary phenomena of nature are regarded by such thinkers as *invariable phenomena so far as experience goes*, but which may cease at any moment. This is, however, a rather exceptional view, most philosophers, even of the religious school, regarding the invariableness of natural phenomena as warranting the conclusion that such invariableness has been established or ordained by the Creator, and although it be admitted that these phenomena may cease at any moment, they would only cease by the abrogation of the natural law, which may be held as only unwritten divine law. As an illustration of a natural law, there may be instanced the invariableness of the phenomena of chemical combination, the constituents of all bodies entering into their formation in definite proportions or multiples of such proportions. When sulphuric acid, water, and carbonate of lime are placed together, there is produced a definite quantity of hydrated sulphate of lime, and the liberation of a certain quantity of carbonic acid gas, depending upon the proportion of the original materials. The hydrated sulphate of lime will also have definite quantities of sulphuric acid, calcium, and water, and the carbonic acid gas will have invariable relative quantities of carbon and oxygen. The invariableness with which bodies move through space under definite circumstances has resulted in the recognition of certain laws called laws of motion, and which have as their basis the law of gravitation. Connected with these are the laws of hydrostatics and of cohesion. A great number of facts have been discovered relating to the phenomena of magnetic and electrical attraction, which, from their invariableness, have been called magnetic and electrical laws. Some philosophers maintain that these laws are inherent properties of matter, others that they are dependent upon external power, but both schools regard them as laws, and as having equal importance in whichever light they are viewed. Advancing from the laws which belong to what is commonly called inanimate matter to those which belong to living matter, it is held by some philosophers that those which regulate chemical phenomena also govern vital phenomena, and that vitality is the result of the action of the general laws of analysis and synthesis.

of all matter, and that all organized beings are the result of natural or physical law, which physical law is inherent in matter itself. Another class of philosophers do not go so far as to deny the agency of divine power in the formation of the organic world, but nevertheless maintain that whatever divine power has been manifested was in the beginning, in the establishment of certain properties pertaining to matter which are termed laws; that creation was accomplished in this way and no other; and that the Creator has not worked by any process of continuous design or action. Again there are other philosophers who maintain that because there are evidences of design in creation it would be unreasonable to believe that God has left the development of living beings to be accomplished by the meeting of unalterable law with accidentally distributed matter. They therefore regard the phenomena of chemical affinity and of vitality as taking place in accordance with separate laws, and that when ascending from ordinary vital action to that of sensation still different laws are involved; and in again ascending from the mere phenomena of sensation to that of thought, still other and higher laws, and such as are beyond the sphere of exact scientific determination, or perhaps of investigation, are involved.

LAW, CANON. See CANON LAW, *ante*.

LAW, CIVIL, or ROMAN. The codification and collection of this law by Justinian became the basis of the system of private law still administered on the continent of Europe, in Scotland, in Mexico and all the Spanish-American republics, and in Louisiana. The researches of Savigny have shown that the civil law was never entirely lost in Europe as has been supposed. The Germanic tribes which, in the 5th c., invaded and conquered Spain, Italy, and Gaul, continued to be governed by the body of customary Germanic law which they brought with them, but allowed the conquered peoples to make profession (*professio*) as to which law they would be governed by, Germanic or Roman. In the 12th c. the university of Bologna became the great law-school of Europe, and the studies of the commentators there increased the influence of the civil law, not only in Italy, but throughout Europe. In southern France the proportion of Germanic immigrants was small, and the civil law prevailed. In northern France the Germanic element was stronger, and in each province its own traditional law or custom was administered, as "the custom of Normandy," "the custom of Anjou," etc. Hence northern France was called the country of customary law, *pays de coutume*, and southern France the country of the written law, *pays de droit écrit*. In the countries which composed the Holy Roman empire, the German emperors, who claimed to be the successors of the Caesars, encouraged the growth of the civil law. In England, though the civil law failed to supplant that body of customary law known as the common law, it had a great influence. The ecclesiastical, a branch of the civil law, had the exclusive control of matters of marriage and divorce. Equity, which has afforded relief for so many technicalities or deficiencies of the old common law, is the product of the civil law, and the chancellor for a long period was an ecclesiastic, bred to the civil and canon law. The common law was largely real property law, and originated in a time when property consisted almost exclusively of land. With the growth of commerce and trade the law of personal property assumed a corresponding importance, and was forced to borrow much, particularly in the departments of commercial and maritime law, from the civil law. The expression *jus civile*, of which civil law is a translation, was used by the Romans in a more restricted sense of the rights peculiar to the citizen by the law of the city or state (*civitas*), as distinguished from the law relating to rights which are recognized by the law and usage of all nations (*jus gentium*). The Roman public law has little but historical interest; the private law demands consideration.

A man's condition and relation with reference to his legal rights constitute his *status* at the civil law. This status consists of personal freedom (*libertas*), citizenship (*civitas*), and control of family (*familia*). Hence men are divided into (1) freemen, *liberi ingenui*; and slaves, *servi*. The power of the master over the slave, which in the earlier ages had been absolute, was afterwards greatly restricted. A slave could receive his liberty by will, by enrollment among freemen in the census, or by a fictitious suit. (2) Citizens, *cives*; and *peregrini*, aliens; the disabilities of the latter, chiefly in the matters of trade and marriage, belong to the domain of public law. (3) Persons of full control, *sui juris*, and persons under the control of others, *alieni juris*. A remarkable feature of the civil law was the power of the father, *patria potestas*, over the person and property of his children and their descendants, except the descendants of a married daughter, who would belong to another family. This power of the head of the family, *paterfamilias*, was such that even in the latest times a man, whatever his age or services, could own no property during the life of his father, save what he might have acquired in war. His father had the use of his son's property during his own life. On the contrary, a boy of the age of 14 years who had no father living was *sui juris*, and could marry, contract, etc. An important division of the family should be mentioned here, that into *cognates* and *agnates*. Cognates are persons united by the same blood or, as in cases of adoption, reputed so to be. Agnates are such relations by blood as can trace descent from a common ancestor to whose paternal power they would be subject. Marriages were not required to be celebrated by any form, and extreme latitude of divorce was allowed, but this was checked by the ecclesiastical courts. Gifts between

husband and wife were revocable until the death of the donor, but were good when so limited or upon divorce. It was customary for the wife or her relations to make a gift, *dōs*, to the husband upon marriage, and such gift had to be restored upon the death of the wife or her divorce where the husband was the guilty party. And similar settlements could be made by the husband for the maintenance of children by the marriage. An infant under 7 years, whose father was dead, must be put under guardianship, *tutela*, and was conclusively presumed to be incapable of contracting. From the age of 7 to 14 his acts must be ratified by his guardian, but after 14 he was deemed liable for his acts and on his contracts. The age of majority in such cases was afterwards fixed at 25, and the law would interfere to avoid contracts made by the minor where they were manifestly to his disadvantage.

As to rights in things, *jura in res*, the Romans divided things according to their origin into corporeal things, *res corporales*; and incorporeal things, *res incorporales*, such as a right of use, of inheritance, etc. Again, with regard to their sacred or secular use, things were divided into things of pious use, *res divini juris*, and things of human use, *res humani juris*. Things for pious use include *res sacrae*; things dedicated to the gods, as a temple, *res religiosa*; things appropriated to the lower gods, as a tomb. Things of human use include private things, *res privatae*, and public things, *res publica*. In regard to their nature things are divided into movable and immovable, *res mobiles* and *res immobiles*. Ownership of things, *dominium*, may be created by occupation, or taking possession of what has not or never had an owner, as treasure-trove; by specification, *specificatio*, where a new article is made from an old; by mixture of one article with another in such a way that they cannot be restored to their former condition, etc. Ownership may also be secured by undisputed adverse use of property in good faith. Under Justinian, such use had to continue for 3 years in the case of movables, and 10 years in the case of immovables, to be a bar to the claim of the original owner. Connected with the ownership of property are sometimes certain rights, *jura in re*, or easements, which give one of two contiguous estates certain privileges in regard to the other, as a right of way, a right of drawing water, etc. But such rights run with the estate, and can impose upon the owner of the servient estate no liability to do any act. There may be also a personal servitude by which one person has the beneficial use of certain property for a term of years or for life.

In the law of obligations, all obligations are said to arise from contract, *ex contractu*, or from wrong, *ex delicto*. Of obligations from contract are verbal contracts or stipulations, written contracts; *mutuum*, a loan to be returned with interest; *commodatum*, a loan for use; *depositum*, where the article is not to be used by the bailee. Grouped together as contracts by agreement are the following: (1) Buying and selling, *emptio*, *venditio*, where the seller agrees to put the buyer in possession of certain property, and the buyer agrees to pay a certain sum therefor; (2) hiring and letting, *locatio*, *conductio*, where the lessor agrees to give the hirer the use of certain property and the hirer agrees to pay a certain sum therefor; (3) agreement to hold property, in common for certain purposes, *societas*; this may be an unlimited partnership, *societas totorum bonorum*; or limited to a single business, *societas alienijus negotiorum*; (4) *mandatum*, an agreement by one party to execute a commission for another party without consideration; a consideration may be given in some other way, but does not appear from the form of contract. This contract was frequently used by parties unable or unwilling to prosecute a suit at law, who would give a mandate to some other person to act as procurator and prosecute the suit for them. Obligations *ex delicto* arise where persons guilty of crime are also civilly liable for damages. Thus a person guilty of larceny, *furtum*, must restore the stolen property or its value and pay a penalty of twice its value, or of four times its value if he were caught in the act. Robbery with violence, *rapina*, was civilly punished with a fine of four times the property, but this included the value of the property taken. Injury to property, *damnum injuriā datum*, entitled its owner to receive from the wrong-doer the highest price the property would have brought 30 days before the injury, or 12 months before in the case of a slave. Inheritance was based by Justinian on cognation, and the heirs took in the following order: (1) Lineal descendants, sons and daughters equally and the children of deceased children by representation; (2) lineal ascendants, with representation of children of deceased brother or sister; (3) children of the half blood with representation; (4) blood relations, nearer preferred to more remote, but those of same degree sharing equally. An heir by the will was bound to pay debts and legacies, but the legacies fell if the heir refused to accept the inheritance. Finally, after various restrictions on the amount of legacies, the heir was allowed by law one-fourth of the net value of the estate of the decedent, so that the legatees could receive but three-fourths, and in case of a falling off, their shares were proportionately reduced. Wills required 5 to 7 witnesses, though they could be made verbally according to certain ceremonies. To make provision for persons incapable of taking a legacy at law, reliance was placed upon the good faith of the heir, and later a special magistrate was appointed to take cognizance of trusts of this description. A slave could not take save by consent of his master; but a slave made heir by his master was adjudged free, though the will contained no directions for his manumission. A testator could not disinherit a child without making distinct reference to him in the will, and a disinherited child who could show that he had committed no offense against his father

could come in for one-fourth of what his inheritance would be if his father had died intestate.

In regard to jurisdiction and procedure little can here be said. In the time of the Christian emperors the municipal and local magistrates had jurisdiction in small matters up to a certain amount; and there was a class of petty magistrates appointed by the emperor, and called *judices pedanei*, whose functions are not clear. There was a special system of courts at Rome, Constantinople, and Alexandria. Appeal lay to the president of the province, to the delegates or vicar of the prefect, to the prefect, and in the last resort to the emperor himself. The army and the clergy were subject to the military and ecclesiastical courts. The plaintiff lodged a complaint against the defendant with the clerk of the proper magistrate, who informed the defendant. The term civil law is sometimes used as the opposite of criminal law. See CODE, JUSTINIANUS, PANDÉCTS, *ante*.

LAW, COMMERCIAL. See MERCANTILE LAW, *ante*.

LAW, CRIMINAL, that department of jurisprudence which treats of violations of public law. Crimes or punishable offenses against the public are divided into treasons, felonies, and misdemeanors—any offense inferior in degree to a felony being a misdemeanor. Offenses are further distinguished as such in themselves, *mala in se*, i.e., offenses regarded by the general moral sentiment of the community as notoriously immoral and injurious to the public; and as offenses by statute, *mala prohibita*, i.e., acts which are made offenses by enactment, but which in the absence of statutory prohibition would not be wrong or immoral. The criminal law regards certain persons, whose reason or will is deficient or subjected to constraint by others, as incapable of committing criminal acts. Lunacy or idiocy will be a sufficient excuse, but the accused is presumed to be of sound mind till the contrary is shown. An infant, from birth up to the age of seven, is conclusively presumed incapable of crime; from seven to fourteen there is still a presumption in his favor, though not conclusive, but rebuttable; after the age of fourteen he is presumed to be capable, and the burden of proof lies upon him to show that he is not. Drunkenness, though it may sometimes have a bearing on the question of intent, is no excuse for criminal acts committed during intoxication or as its immediate result; but it is otherwise where continued habits of drunkenness are the more or less proximate cause of insanity. A married woman, acting by the command and under the coercion of her husband, will not be responsible; but such coercion must be shown and will not be presumed from the mere presence of the husband. Duress, actual physical constraint, or extreme bodily fear, caused by acts or threats of violence, will sometimes excuse an otherwise criminal act. In such a case the degree of violence must be such as would exercise a constraint upon a reasonable and prudent man. Acts which are the result of mistake or inevitable necessity, and to which consequently intent is wanting, will be excused, but ignorance or mistake as to the law will not excuse.

Rights of the accused.—By the constitution of the United States the accused has a right to be informed of the nature and cause of the accusation against him and to be confronted with the witnesses against him. The prisoner cannot be brought to trial till a grand jury has found a true bill against him; he is then entitled to a trial by an impartial jury of his peers, whose finding upon matters of fact is conclusive. The criminal law presumes the accused to be innocent till his guilt is established, and in passing upon his guilt or innocence the jury cannot bring in a verdict of guilty upon such evidence as would justify a verdict for or against a party in a civil suit. In the latter a jury renders a verdict for the party in whose favor there is a preponderance of evidence; in a criminal cause a verdict of guilty is not justifiable unless the minds of the jurymen are satisfied beyond a reasonable doubt of the guilt of the accused. The accused cannot be compelled to criminate himself, nor can his general character and habits be examined at the trial to show the probability of his guilt. No person can be punished for an act which has been made an offense by a law subsequent to the commission of the act, nor can any person be twice put in jeopardy of life or limb for the same offense. The old rule of the criminal law prohibiting the accused from testifying in his own behalf has been abolished in many states of the union, and the change on the whole has worked well. The criminal law distinguishes criminals according to the degree of their participation as principals and accessories. A principal is the person who immediately commits the unlawful act; a principal in the second degree is a person who did not immediately commit the act, but who was present at its commission, aiding and abetting it. A principal in the second degree need not be actually, but only constructively present. It is sufficient that by arrangement with the principal he is in a position where he can help in the commission of the act. An accessory before the fact is one who procures another to commit a felony without being himself present at its commission. There can be no accessories to treason on account of its heinousness, to manslaughter on account of its suddenness, or to misdemeanors. An accessory before the fact is equally guilty with the principal of the act committed by the principal at his instigation; but if the principal, being procured by the accessory to commit a certain crime, commit another and different crime not a natural consequence of the former, the accessory to the first act will not be held accessory to the second. Thus, if one procure another to commit burglary, and the principal commit the totally different crime of arson, the first person

will not be liable as an accessory to the arson. An accessory after the fact is one who gives aid and comfort to a felon after the felony, knowing him to have committed it. But a wife is not such accessory for receiving and aiding her husband guilty of felony. As an accessory is not guilty unless his principal be guilty, he cannot be tried unless his principal have been convicted; but, even if his principal have been convicted, the accessory may still dispute his principal's guilt at his own trial.

The various offenses of which the criminal law takes cognizance may be classified as follows: 1. Offenses against the sovereign or state: treason, misprision of treason. 2. Offenses against the public or the persons and property of individuals: conspiracy. 3. Offenses against the persons of individuals: abduction, assault and battery, attempts to commit homicide, false imprisonment, homicide, kidnaping, mayhem, rape, robbery. 4. Offenses against the property of individuals: arson, burglary, embezzlement, false pretenses, larceny, malicious mischief. 5. Offenses against public property. 6. Offenses against public justice: barratry, bribery, champerty, compounding of felony, contempt of court, destruction of public records, escape, extortion, jail-break, maintenance, oppression, perjury, resistance to officers, suppression of evidence. 7. Offenses against the public peace: breach of the peace, challenging to a duel, libel, riot, rout, unlawful assembly. 8. Offenses against public policy: counterfeiting, false currency, forgery, gambling, lotteries, nuisance, violation of suffrage laws, violation of game laws. 9. Offenses against public morality: adultery, bestiality, bigamy, blasphemy, cruelty to animals, drunkenness, fornication, incest, keeping house of ill-fame, obscenity, profanity, sabbath-breaking, seduction, sodomy. See the articles on these offenses, and further, CRIME; CAPITAL PUNISHMENT; PROSECUTION; *ante*.

LAW, ROMAN OR CIVIL. See LAW.

LAW, EDMUND, D.D., 1703-87; b. near Cartmel, Lancashire; graduated at St. John's college, Cambridge, in 1723, and was at once appointed to a fellowship. In the same year he was appointed rector of Graystock in Cumberland, in 1743 archdeacon of Carlisle, and in 1754 master of Peterhouse college, Cambridge. Subsequently he became librarian of the university, professor of casuistry, and archdeacon of Lincoln. In 1767 he was chosen prebendary of Durham, and in 1768 became bishop of Carlisle. He was a learned and liberal prelate, and one of the acute metaphysicians of his time. Among his works were a translation from the Latin, with extensive notes, of archbishop King's *Essay on the Origin of Evil*; an *Enquiry into the Ideas of Space and Time*; *Considerations on the Theory of Religion*; and *Reflections on the Life and Character of Christ*. He also wrote a biography of John Locke, which was appended to an edition of the works of that great philosopher. One of his sons was the first lord Ellenborough, and two others were bishops of the national church.

LAW, EDWARD, Lord ELLENBOROUGH. See ELLENBOROUGH, EARL OF, *ante*.

LAW, FEUDAL. See FEUDAL SYSTEM, *ante*.

LAW, FOREIGN. See FOREIGN COURTS, *ante*.

LAW, JOHN, comptroller-general of the finances of France, and famous for his credit operations during the minority of Louis XV., was born at Edinburgh, April 21, 1671. His father was a goldsmith and banker, and proprietor of the estate of Lauriston, near Edinburgh. Law early showed a most remarkable talent for arithmetic, algebra, and kindred sciences. After the death of his father he removed to London, where he was admitted into the first circles of fashion, but was soon compelled to flee, in consequence of a duel in which he killed his adversary. He went to Amsterdam, and spent his time in studying the credit operations of the bank. About the year 1700 he returned to Edinburgh, a zealous advocate of a paper currency; but his proposals to the Scottish parliament on this subject met with an unfavorable reception. He now visited different parts of the continent, where he accumulated a large fortune by gambling, but sought in vain to win the favor of governments to his banking schemes. At last he settled in Paris, and in company with his brother William set up, in 1716, a private bank, which was soon successful and prosperous to such an extraordinary degree, that the duke of Orleans, the regent, adopted, in 1718, Law's plan of a national bank, and issued prodigious quantities of bank-notes, which enjoyed perfect credit, whilst the ordinary national bonds remained, as they had long been, at a price far below their nominal value. In 1719 Law originated his Mississippi scheme (*q.v.*), and the following year was made a councilor of state and comptroller-general of finances; but on the failure of his scheme, and the insolvency of the national bank, he resigned the latter office, and thought it prudent to quit France. He proceeded first to Brussels, but finally settled in Venice, where he managed to eke out a wretched living by gambling, and died there in May, 1729. A complete edition of his works was published at Paris in 1790, and another in 1843.

LAW, MUNICIPAL, is the law or system of law by which a particular country is governed. The municipal law of the continental nations is based upon the civil law; that of England and the United States is made up of common law and statute law. The common law is composed of immemorial usages and customs which have not been sanctioned by any legislative acts. Such customs are either general, i.e., adopted throughout the whole country, or particular, i.e., restricted and peculiar to one district.

Instances of general customs are: "Inheritance never ascends," "The burden of proof is on the plaintiff," "Buildings pass by a grant of the land," etc. The common law is in theory an unwritten law, though the decisions of the courts in which that law is declared may appear in written or printed reports. The report of a particular case is not regarded as the law, but as a written statement, applicable to the facts of that case, of a principle of law which is in theory never written. Statute law, the other component of municipal law, is that law which is established by act of legislature. See STATUTE. In the United States, except Louisiana, the common law, and generally speaking the English statute law up to the time of the separation of the colonies from England, are the foundation of municipal law, and are so declared in many state constitutions. As each state has its own courts, with power to give their own independent interpretation to the law, and its own body of statute law enlarging or restraining the operation of the common law, there is no proper United States municipal law. The systems of municipal law in the several states do not, however, greatly differ, except in details. Municipal law as the law of a particular state is opposed to international law, and the municipal law of one country is foreign law in the courts of any other country. The divisions of municipal law are named according to the subjects of which they treat; thus, criminal law, military law, etc. See FOREIGN LAW, LAW CRIMINAL, etc.

LAW, RICHARD, LL.D., 1733-1806; b. Milford, Conn.; son of governor Jonathan; graduated at Yale in 1751; studied law and settled in New London. He was a delegate to the continental congress in 1777-78 and in 1781-84. For more than 20 years he was mayor of New London, also successively a justice and chief-justice of the state supreme court, and judge of the district court of the United States by the appointment of Washington. He assisted Roger Sherman in revising the laws of Connecticut. Died at New London.

LAW, WILLIAM, an influential religious writer of last century, was b. at Kingscliffe, Northamptonshire, in 1686, and educated at Emmanuel college, Cambridge, where he took his degree of M.A. in 1712. He was for some time tutor to Edward Gibbon, father of the historian, who speaks of his piety and talents with unusual warmth. About 1740 two of his friends, Miss Hester Gibbon, sister of his pupil, and Mrs. Hutcheson, widow of a London barrister, having resolved to retire from the world, and devote themselves to works of charity and a religious life, chose Law for their almoner and instructor. The ladies settled at Kingscliffe, and here Law died, April 9, 1761. Law's writings are deeply tinged with what is commonly called mysticism. His principal work is his *Serious Call to a Devout and Holy Life* (1729), a treatise that first awakened the religious sensibilities of Dr. Johnson, who speaks of it in high terms, and from which the brothers Wesley also derived much advantage. Next to the *Serious Call*, his most important works are his answer to Mandeville's *Fable of the Bees* (published 1724; republished, with an introduction by the Rev. F. D. Maurice, 1844), his letters to the bishop of Bangor, *The Way to Knowledge*, and *The Spirit of Love*. His collected works were published (Lond., 9 vols. 1762).

LAW-BURROWS, LETTERS OF, in Scotch law, a writ or document in the name of the sovereign, commanding a person to give security against offering violence against another. The person applying for or issuing the letters must swear to the truth of some cause of alarm, such as actual personal violence or threats of violence. Sometimes a wife may apply for lawburrows against a husband. The person against whom the letters are directed must find caution to keep the peace within a certain number of days specified, and this he does by executing a bond of caution. If he, notwithstanding, use violence, an action of contravention of lawburrows may be raised against him before justices of the peace, and he is fined in a sum equal to the actual damage resulting, which is paid to the party injured. An action lies against a person who maliciously takes out letters of lawburrows against another. Lawburrows corresponds to what are called articles of the peace (q.v.) in England or Ireland.

LAWES, HENRY, about 1600-62; b. at Salisbury, England; a pupil of John Cooper, and in 1625 was connected with the royal chapel of Charles I., after which he gained celebrity as a composer of music for masques and songs. It was under his personal direction that Milton's *Masque of Comus* was set to music and produced at Ludlow castle in 1634. Milton, who was probably his pupil in music, refers to him in highly eulogistic terms in several of his poems. He popularized the songs of Waller, Herrick, and Phillips, who showed high appreciation of his labors. He composed the anthem for the coronation of Charles II., and in 1653 published *Ayres and Dialogues, for One, Two, and Three Voices*. Died in London, and was buried in Westminster abbey. An elder brother, WILLIAM LAWES, was also attached as a musician to the royal chapel, and was associated with him in some of his musical undertakings. This brother, who was killed at the siege of Chester, composed the music for Sandys's version of the Psalms in 1648.

LAW-MERCHANT, a name often used in law to denote the customs which have grown up among merchants in reference to mercantile documents and business, such as bills of exchange, bills of lading, etc. These customs become incorporated with, and form part of, the common law, and are binding as such.

LAW-MERCHANT (*ante*), a system of law consisting largely of the usages of trade, and applied by courts to the contracts and dealings of persons engaged in mercantile business of any kind. Blackstone classifies it as one of the "customs" of England, and so a part of the common law; but it is not properly a custom, as it is not restricted to a single community, and is not a part of the municipal law of a single country, but regulates commercial contracts in all civilized countries. The body of mercantile usages which compose this branch of law, having no dependence upon locality, does not need to be established by witnesses, but judges are bound to take official notice of it. The principal branches of the law-merchant are the law of shipping, the law of marine insurance, the law of sales, and the law of bills and notes. The feudal law, which grew up in a time when property consisted chiefly of land upon whose alienation great restraints were laid, was found inadequate for the needs of the mercantile classes who were coming into prominence. The courts, when commercial contracts were brought before them, adopted from merchants the rules which regulated their business dealings and made them rules of law. Many of these rules were in direct contradiction to the common law. Magna Charta contained a special provision guaranteeing to merchants, among other things, the right "to buy and sell according to their ancient customs," and many later statutes were enacted for their special protection. As the custom of merchants began to encroach upon the common law, there was a determined effort on the part of lawyers to resist it. It was attempted to make the custom of merchants a particular custom, peculiar to a single community, and not a part of the law of the land. It was finally decided, in the reign of James I., to be part of the law of the realm. An attempt was then made to restrict the application of the law-merchant to persons who were actually merchants, but the courts, after considerable variance, held that it applied to the same contracts between parties not merchants.

LAWN, from the old English *lawnd*, signifying an open space between woods. The word is now used to designate grass kept closely cut or fed so as to form a plush-like carpet, and generally applied to the well-kept grass which forms the ground surface for decorative gardening. F. J. Scott, in his work on *Home Grounds*, defines a lawn as "a close-fitting green robe thrown over smoothed surfaces of the earth, through which every undulation is revealed, and over which the sunlight will rest as upon velvet, and shadows of objects be clearly outlined as upon a floor."

American writers formerly supposed the perfection of English lawns unattainable in the United States. This is a mistake. No finer lawns can be found than in the suburban homes and parks of our cities. It was principally lack of attention to them, and not fault of climate, that formerly made the comparison unfavorable to the United States. Yet the longer droughts to which this country is subject give the British islands a short advantage in summer, and their milder winters leave their lawns greener and less covered by snows. The great heat of our summers, however, which writers have alluded to as hurtful to grass, is hurtful only when moisture fails. We have never seen more velvety turf in England than in this country on a sandy loam in times of intense and prolonged heat and drought, but where daily water by hose at night supplied the required moisture. The three essentials for a velvety lawn are: First, a rich soil in which neither clay nor gravel and sand are largely predominant. A pure rich clay dries and bakes too quickly, and an excess of moisture upon it prepares it to dry and crack the more quickly afterwards. An open gravelly soil dries quickly, and does not give sufficient food for the grass roots at the surface. Compact sandy soils, which contain clay, but not enough to make them sticky after a rain, are best of all. An abundance of vegetable and animal manure in any of these soils is as essential to the permanent beauty of a lawn as to the growth of a corn crop. The second requirement to perfect a lawn is, incessant grazing or cutting. The admirable lawn-cutters now in universal use have taken the place of the manual labor that made England's lawns so beautiful, and served to prove that labor, and not climate, was what our lawns lacked. Lawns should be cut in May and June about once a week, with longer intermission in the driest and hottest part of the summer. A few years since it was supposed that the short tips of grass which the lawn cutters remove could be left to drop into it, to enrich the surface by its decay, as it at once falls out of sight and is covered by the fresh growth. But experience has shown that frequent cutting soon leaves such a thick film of these decaying leaves at the roots, that it molds, smothers the grass, and finally kills it. Dead patches are frequently seen in lawns once beautiful that are caused by slow deposits of this kind. In the fall, just before a top-dressing of manure, or in the spring, a lawn should be raked clean to the roots with an iron garden rake to get this film of dead grass-leaves all out. It is a very different kind of raking from that required to remove the surface grass, and requires muscle and close attention. The third requirement is constant moisture. Where city water-works can be used, or higher springs which supply a force that make lawn fountains and hose sprinklings practicable, there need be no failure in lawns, if the foregoing conditions are found. Parks must of course have generous provisions for artificial waterings.

The sorts of grasses to be used where an extensive surface is to be seeded depend much upon the soil and latitude. It is safe to say that the best pasture grasses of the neighborhood are always the best lawn grasses. Small lawns should be sodded from

these pastures, or at least have the walks bordered by sod. But the pastures are made up of many species of grass; one forming the bulk of the feed in the spring, another in the summer, and another in the fall. The Kentucky blue grass, however, is the main-stay, though in the heat of summer a shorter variety of the same species, and white and yellow clovers make a considerable part of the feed. After Sept. rains, white clover covers the same ground and is the main grass of autumn pastures. The seeds of many of the low-growing and creeping grasses cannot be gotten at seed stores, so that the choice is confined to blue grass, white clover, and red-top. The proportion of these by quart or bushel measure may be four parts of blue-grass to one each of the others. The Rhode Island bent grass may be used in the place of red-top. It is a mistake to sow oats or any other crop with grass for the purpose of shading it. The young grass no more needs shade of oats than young oats the shade of corn. It will thrive better without, and as weeds are quick to make a business of shading the young grass they should be cut as soon as they show, and continuously. Young grass is often smothered by a rank growth of weeds that are permitted to cover the ground first. Sowing times for grass are, in autumn, Sept.; and in the spring, the moment when the ground is settled enough to surface it. Autumn top-dressings of well-rotted manure are invaluable, and should be spread late in the fall, and cleanly raked off as soon as the ground is settled in the spring.

LAW OF NATIONS. See INTERNATIONAL LAW.

LAWN TENNIS, a modified form of the old game of tennis (q.v.), has recently become a popular pastime alike for ladies and gentlemen. The ground on which it is played is a strip of turf (sometimes asphalt), 78 ft. in length by 30 in width at the extremities. Across the center extends a net 5 ft. high, stretched from poles 24 ft. asunder. Lines are drawn marking the boundaries, and dividing each of the portions of ground separated by the net lengthwise into a right court and a left court. Any number of players may join; but the best game is played by two or four persons. The player who begins stands just on the back boundary of the right court on his side, throws up the ball, and on its rebound strikes it with the racket so that it shall fall over the net into the nearer part of the right court diagonally opposite him. His opponent there is bound to strike back the ball either before it reaches the ground or after the first rebound. It is then returned again by the first player, who continues to play till he fails to return the ball, sends it without the boundaries, or commits some of the other "faults" recognized by the rules; when his opponent takes his turn.

LAWRANCE, JOHN, 1750-1810; b. in Cornwall, Eng.; emigrated to New York in 1767; admitted to the bar in 1772. He was aid-de-camp to Washington in 1777, and judge-advocate at the trial of maj. André. In 1785 he was a member of the continental congress, and of the new congress, 1789-93. From 1794 to 1796 he was district judge of the United States; 1796-1800 a member of the U. S. senate, and for a part of the time its presiding officer. He was a zealous defender of Washington and Hamilton. Died in New York.

LAWRENCE, a co. in n. Alabama, watered by affluents of the Tennessee river, which forms its northern boundary, and Town creek, running northward and entering the former river near the Muscle Shoals rapids; navigation on the Tennessee being obstructed at the point where it separates this from the counties of Lauderdale and Limestone; about 850 sq.m.; pop. '80, 21,391—21,310 of American birth, 8,809 colored. The Memphis and Charleston railroad crosses the northern section. Its surface is hilly, particularly in the s., where it rises into high table-lands. A large proportion of the soil is under cultivation, and produces corn, oats, wheat, tobacco, honey, and sorghum. Sheep and swine are raised, and the dairy yield is considerable. Number of farms in '70, 2,046; over 1000 acres, 9. Cash value of farms in '70, \$1,413,284. It had in '70, 33 manufacturing establishments, with a capital of \$22,955, and an annual product of \$129,340. Seat of justice, Moulton.

LAWRENCE, a co. in n.e. Arkansas, intersected by the St. Louis, Iron Mountain and Southern railroad, and drained by Black river; two of whose branches uniting in the n. and form a part of its northern boundary; about 600 sq.m.; pop. '80, 8,782—8,654 of American birth, 467 colored. The Cache river flowing s. and emptying into the White river forms its eastern boundary. It has a level surface partially diversified by ridges of table land and large forests. It has a rich alluvial soil, and deposits of copper, zinc, and lead. It has manufactories of woolen goods and zinc works. Its vegetable products are grain, tobacco, cotton, sorghum, and hops. Seat of justice, Smithville.

LAWRENCE, a co. in s.e. Illinois, on the Wabash river, which separates it from Indiana; traversed by the Embarras river, and by the Ohio and Mississippi and the Cairo and Vincennes railroads; about 350 sq.m.; pop. 12,533. The soil is fertile. Chief productions, cattle, corn, wheat, wool, grass, and pork. Valuation of real and personal property, \$7,391,080. Capital, Lawrenceville.

LAWRENCE, a co. in s. Indiana, watered by the East Fork of the White river, flowing from w. to e. through its southern portion, with Salt creek flowing from the n. and emptying into it, and Indian creek forming part of its western boundary. It is intersected by the Ohio and Mississippi railroad and the Louisville, New Albany, and

Chicago railroad, forming a junction at Mitchell in its southern portion, and its county-seat is the terminus of the Bedford, Springville, Owensburg, and Bloomfield railroad; 450 sq.m.; pop. '80, 18,543—18,216 of American birth. Its surface is hilly, having an abundant growth of building timber, and a stratum of limestone beneath a fertile soil. Coal is found and beds of kaolin, formed from the decomposition of feldspar, and used in making porcelain. Number of farms in 1870, 1255, with 2 of 1000 acres and over. Cash value of farms in 1870, \$4,892,988. Its agricultural products include buckwheat, wool, tobacco, sweet potatoes, oats, corn, rye, wheat, maple sugar, sorghum, and live stock. In 1870 it produced 205 gall. of wine and 3,812 lbs. of honey. At Fort Ritner is a tunnel 1786 ft. in length for the accommodation of the Ohio and Mississippi railway trains. Trade is active in its towns, and its manufactories consist of woolen mills, planing mills, cigar and tobacco factories, carriage shops, and steam saw-mills. Seat of justice, Bedford.

LAWRENCE, a co. in e. Kentucky, separated from West Virginia by the Big Sandy river, an affluent of the Ohio, which is navigable by small steamboats up to this point, and forms its eastern boundary; 350 sq.m.; pop. '80, 13,262—13,227 of American birth, 241 colored. The West Fork of the Big Sandy divides the eastern portion, and unites with the Tug Fork on its eastern border to form the larger river. The surface is uneven, two-thirds covered with forests. In the cultivated portion of the valleys the soil is found to be suited to the production of buckwheat, barley, oats, corn, tobacco, rye, wheat, and sweet potatoes, and for the raising of live stock; other products are honey, sorghum, maple sugar, and flax. Vast deposits of coal and iron have been found. Number of farms in 1870, 707, with one of over 1000 acres. Cash value in 1870, \$592,678. Seat of justice, Louisa.

LAWRENCE, a co. in s. Mississippi, intersected centrally by the Pearl river and watered by its branches; 580 sq.m.; pop. '80, 9,422—9,410 of American birth. Its surface is diversified by forest and plain. In the forests are extensive tracts of building timber of oak and pine; among ornamental trees the magnolia, beech, and cypress grow in great luxuriance. The soil where cultivated is found to be productive of tobacco, rice, oats, corn, cotton, sweet potatoes, and sugar-cane. Seat of justice, Monticello.

LAWRENCE, a co. in s.w. Missouri; intersected by the St. Louis and San Francisco railroad, and drained by the head-waters of Sac and Spring rivers; 576 sq.m.; pop. '80, 17,585; surface undulating and covered to a large extent with forests; chief products, corn, wheat, oats, and hay; valuation of real and personal estate, \$3,000,000. Capital, Mt. Vernon.

LAWRENCE, a co. in s. Ohio, has the Ohio river for its boundaries on the s., and e., and w., separating it from Kentucky, and is watered by Symmes' creek and numerous rivulets; about 420 sq.m.; pop. '70, 31,380—28,798 of American birth. It has a surface of alternate sandstone hills, fertile plain and forest, and its soil is unusually fertile. It has one short railroad 3 m. in length running from Center Furnace, in the central portion, to Ironton on the Ohio river, and a branch road to Whitwell of 2 m. in length. Number of farms in 1870, 1217, with 1 of 1000 acres and over. Cash value of farms in 1870, \$2,892,997. In its hills are inexhaustible beds of iron ore, bituminous coal, and clay. It has three coal mines, employing 165 men (150 underground), with a capital of \$210,610; annual product, \$112,880. It has twelve mines of iron ore, employing 626 men (60 underground), with a capital of \$744,050; annual product, \$286,502. Its leading industries are the manufacture of tin, copper, and sheet-iron ware, pig-iron, engines and boilers, bricks, and charcoal. It has flour, planing and saw mills, cooper shops, and rolling mills. Its agricultural products include the raising of grain, tobacco, sweet potatoes, flax, maple sugar, sorghum, and live stock. In 1870 it produced 143 gall. of wine and 5,242 lbs. of honey. Seat of justice, Ironton.

LAWRENCE, a co. in w. Pennsylvania, watered by small creeks and the rivers Mahoning and Shenango, uniting in the central portion to form the Beaver, which empties into the Ohio; about 400 sq.m.; pop. '80, 33,311—30,207 of American birth, 235 colored. The Newcastle branch of the Erie and Pittsburg railroad, the Youngstown branch of the Pittsburg, Fort Wayne, and Chicago railroad, and the Newcastle and Franklin railroad, form a junction at Newcastle in the central portion. The Beaver and Erie canal traverses the n.w. section, following the course of the Shenango river. It had in 1870, 11 coal mines, employing 245 hands (197 underground), with a capital of \$289,050; annual product, \$281,511. It had 3 stone quarries, employing 66 hands, with a capital of \$22,000; annual product, \$58,000. Its leading industries are the manufacture of bricks, brooms, carriages, window glass, iron, machinery, saddlery and harness, and woolen goods; it has also the product of flour, planing, and saw mills. Product of manufactures in 1870, \$3,439,700. Its surface is uneven, with a small proportion of woodland. Its rich tillable lands produce vast quantities of grain, flax, and tobacco; they also furnish an immense dairy product. A large amount of honey, maple sugar, syrup and sorghum is exported. Number of farms in 1870, 2,188; over 1000 acres, 2. Cash value of farms in 1870, \$11,614,044. Seat of justice, Newcastle.

LAWRENCE, a co. of middle Tennessee, bounded s. by Alabama, and drained by Shoal creek and other streams; 630 sq.m.; pop. '80, 10,383; surface undulating or level,

and extensively covered with forests; soil partly fertile; chief productions, corn, cotton, and pork. Iron ore and limestone abound. Valuation of real and personal estate, \$1,250,000; capital, Lawrenceburg.

LAWRENCE, a city of Kansas, in Douglas co., on the Kansas river, founded in 1854; pop. '70, 8,820. It is well built, and lighted with gas, and sustains 25 churches, and a graded public school system, with high school department. The state university, situated here, is an important public institution. The following lines of railroad connect Lawrence with the surrounding country: Kansas Midland; St. Louis, Lawrence; and Denver; Lawrence and South-western; Leavenworth, Lawrence, and Galveston; and Kansas Pacific. At the time of the formation of the republican party, and during the exciting anti slavery period which preceded the outbreak of the Rebellion, Lawrence was the center of the anti-slavery element in Kansas. In 1863 the city was almost entirely destroyed by a raiding party under Quantrell.

LAWRENCE, a city of Massachusetts, U.S., on both sides of the Merrimack river; 26 m. from its mouth, and the same distance n. of Boston. It is a handsome manufacturing city, with a park, and fountains supplied from a reservoir 140 ft. high; has 21 churches, 6 newspapers, and cotton and woolen manufactories employing a capital of \$8,000,000. These are supplied with water-power by a granite dam across the Merrimack river, 1629 ft. long, and at the deepest part 40 $\frac{1}{2}$ ft. high, which has created a basin 9 m. long. The water is distributed to the mills by a canal 1 m. long, 100 ft. wide, and 12 deep. The city has been entirely built within a few years, and was incorporated in 1853. Pop. in 1870, 28,932.

LAWRENCE (*ante*), a city of Massachusetts and one of the capitals of Essex co., situated on both sides of the Merrimack river, 26 m. n.w. from Boston, and on the Boston and Maine, the Lowell and Lawrence, and the Manchester (N. H.) and Lawrence railroads; pop. '60, 17,639; '70, 28,921; '80, 39,178. The Merrimack at this point has a descent of 26 ft. within the distance of half a mile, affording a water-power of almost unlimited extent—a circumstance which in 1845 led to the selection of the place as a site for a manufacturing city. Abbott Lawrence, Nathan Appleton, and other wealthy manufacturers of Boston enlisted in the enterprise, and the Essex company was incorporated for the purpose of carrying it into effect. A dam of solid granite, 900 ft. long and 40 ft. high, was thrown across the rapids, and a canal 90 ft. wide and more than a mile in length constructed for the utilization of the water. The works were completed Oct. 14, 1847, at a cost of \$350,000, and in the following February the first wheel was set in motion by water from the canal. A second canal on the side of the river opposite the first has been built, and an immense capital has been invested in the erection of cotton and woolen mills, and in other branches of manufactures. The place was named in honor of the Lawrence family, several of whose members were among the founders. It was incorporated as a town in 1817, and as a city in 1853, since which time its development has been almost unexampled in New England. The amount invested in the cotton manufacture can hardly be less than \$7,000,000, while that employed in the manufacture of woolens is probably not much less. The city has more than 20 churches, 2 national and 3 savings banks, 2 daily and 4 weekly newspapers, 60 public schools, a public library of 14,000 volumes, a beautiful park of 17 acres, a court-house, city hall, high school (costing \$80,000), music hall, and other public buildings. The assessed value of property in 1875 was \$24,117,373. All the mills and most of the stores and private houses are lighted with gas.

LAWRENCE, SAINT, the deacon, one of the most celebrated martyrs of the early church, the subject of many ancient panegyrics, and of one of the most elaborate of the hymns of Prudentius. He was one of the deacons of Rome, in the pontificate of Sixtus I. (3d c.), and as such was especially charged with the care of the poor, and the orphans and widows. In the persecution of Valerian, being summoned, according to the legend, before the prætor as a Christian, and being called on to deliver up the treasures of the church, he mockingly produced the poor and the sick of his charge, declaring that "those were his treasures"; and on his persisting in his refusal to sacrifice, being condemned to be roasted on a gridiron, he continued throughout his tortures to mock his persecutors. Many of the details of his martyrdom are probably due to the imagination of the poetical narrator; but the martyrdom is unquestionably historical, and dates from the year 258. His feast is celebrated on Aug. 10.

LAWRENCE, ABBOTT, LL.D., 1792-1855; b. Groton, Mass. He served an apprenticeship in Boston to his brother Amos, and in 1814 entered into partnership with him. The brothers Lawrence carried on an extensive trade in the sale of cotton and woolen goods on commission. They were the agents of the cotton manufactories at Lowell, and were afterwards heavily interested in the manufacturing corporations at the new town of Lawrence, which was named in honor of their firm. Abbott Lawrence served a term in congress 1835-37, and a partial term 1839-40. He was a prominent member of the whig party, whose nomination for the vice-presidency, in 1848, he lost by only six votes. Gen. Taylor, on his accession to the presidency, offered Lawrence a seat in the cabinet, which he refused, but accepted the place of minister to England, where he remained for three years, when he was recalled at his own request. In London he

entertained with great splendor, and received the most flattering social attentions. Like his brother Amos, Abbott Lawrence was a man of great benevolence, and besides his liberal private charities, founded and endowed at Harvard university a scientific department, called in his honor the Lawrence scientific school.

LAWRENCE, AMOS, 1786-1852; b. Groton, Mass. He began business in Boston as a dry-goods merchant, 1807; took his brother Abbott as partner in 1814; and retired from active business in 1831, thenceforward devoting his time to the care of his large property and to benevolent objects. He is said to have given over \$600,000 for charitable and educational purposes in the last 20 years of his life. He was a liberal benefactor of Williams college, of the academy in Groton, of the theological seminary at Bangor, Me., and of Kenyon college, Ohio. His private charities also were large.

LAWRENCE, JAMES, 1781-1813; b. Burlington, N. J.; entered the navy as a midshipman in 1798; was promoted to lieut. in 1802; and distinguished himself in the bombardment of Tripoli. He was prominent in the war with England, 1812-15; in command of the *Hornet* near the mouth of the Demerara river captured the British sloop of war *Peacock*, Feb. 24, 1813, for which exploit he received from congress a gold medal, and was promoted to command the frigate *Chesapeake*, and was mortally wounded in the engagement between the British frigate *Shannon* and the *Chesapeake* in Boston harbor, June 1, 1813. This was the most desperate sea-fight of the war, the Americans not surrendering until nearly all their officers were killed or wounded. Capt. Lawrence, while being carried below, uttered his since celebrated exclamation, "Don't give up the ship." He died in Halifax, July 5. This distinguished officer lies buried in Trinity church-yard, New York, where his monument is a chief object of interest.

LAWRENCE, Baron the right honorable JOHN LAIRD-MAIR, is younger son of lieut.-col. Alexander Lawrence, who served in the Mysore campaign, and at the capture of Seringapatam. Born at Richmond, Yorkshire, 1811, he obtained, in 1827, a presentation to Haileybury college, where he carried off the chief prizes. His first years in the Indian civil service were spent in Delhi and the neighborhood. On the annexation of the Punjab, Lawrence was appointed commissioner, and afterwards lieut.gov. of the Punjab. When the Indian mutiny broke out, he proved the mainstay of the British dominion in India. The once restless Sikhs had become so attached to his firm and beneficent rule, that Lawrence was enabled to send troops to the relief of Delhi, etc. So timely was this succor, and so great was his foresight, that he was styled "the savior of India." On his return to England he received the thanks of parliament, with the grant of a pension of £1000 a year. He was made a baronet in 1858, and a privy-councilor in 1859. In 1861 Lawrence was nominated one of the knights of the "Star of India." In 1863 he succeeded the late lord Elgin as gov.gen. of India; he was made a member of the Indian council, and the court of directors of the East India company granted him a life pension of £2000 a year. In 1869 he was raised to the house of peers. At the first election of the London school-board in 1870, lord Lawrence was elected chairman, a post he subsequently resigned.

His elder brother, brig.gen. **SIR HENRY MONTGOMERY LAWRENCE**, born in 1806, was chief commissioner of Lucknow, and virtually governor of Oude when the Indian mutiny broke out. While in command of the handful of heroic men who defended the women and children in the residency of Lucknow, sir Henry was wounded by the explosion of a shell, and died July 4, 1857. He was the founder of the Lawrence asylum for the reception of the children of the European soldiers in India. A monument to his memory has been placed in St. Paul's cathedral.

LAWRENCE, Sir THOMAS, president of the royal academy, was b. at Bristol in 1769, and at the early age of ten years entered on the profession of a portrait-painter in crayons, at Oxford, where he immediately obtained full employment. There is an engraving which bears to have been "directed by I. K. Sherwin," the celebrated engraver, of a portrait of the young artist; it is dedicated in the following terms: "To the nobility and gentry in general, and the university of Oxford in particular, who have so liberally countenanced his pencil, this portrait of Master Lawrence is inscribed by their most devoted and most grateful servant, T. Lawrence, senior." It was published by Lawrence, senior, at Bath, June 18, 1783, along with a print of Mrs. Siddons in the character of "Zara," drawn by Master Lawrence, and engraved by J. R. Smith. The young artist next set up at Bath, where he met with great encouragement; and, at the age of 18, settled in London, and entered as a student of the royal academy, having a year previously taken to painting in oil. His success was extraordinary; in 1791, before he attained the age required by the laws of the academy, he was elected a supplemental associate by desire of the king; on Reynolds's death a year afterwards, was appointed limner to his majesty; was made a royal academician in 1798; knighted in 1815; and on Benjamin West's death in 1826, succeeded him as president of the royal academy. He died in London, Jan. 7, 1830. Lawrence was the favorite portrait-painter of his time, had an immense practice, and obtained larger prices for his works than were ever paid to any previous portrait-painter. His talent as a painter was doubtless overrated during his life, but justice has scarcely been done to it of late years; for his style, though in many respects meretricious, was greatly influenced by the fashion and dress of the period, and in time to come, impressions of the principal characters who figured during the regency,

and in the reign of George IV., will be taken mainly from his works. His portraits in the Waterloo gallery at Windsor are of the greatest historical value. He was a man of great urbanity and fine taste, and left a most valuable collection of drawings by the old masters, now unfortunately broken up. See *Life and Correspondence of Sir T. Lawrence*, by Williams (1831); and Cunningham's *Lives of British Painters* (1833).

LAWRENCE, TIMOTHY BIGELOW, 1826-69; b. Boston; son of Abbott; graduated at Harvard in 1846. He was an attaché of the American legation in London, while his father was minister at the British court. In 1862-69 he held the post of U. S. consul-general in Italy. Died in Washington, D. C.

LAWRENCE, Sir WILLIAM, a distinguished surgeon, was b. at Cirencester, in Gloucestershire, in July, 1783. In 1800 he went to London, and was apprenticed to Mr. Abernethy, by whom before the end of three years he was appointed demonstrator in anatomy to Bartholomew's hospital. In 1813 he was made surgeon to the hospital, and was chosen fellow of the royal society; and after holding various important surgical appointments, he became, in 1815, one of the professors of anatomy to the royal college of surgeons. In 1828-29 he succeeded his teacher, Mr. Abernethy, as lecturer on surgery to St. Bartholomew's. From this period Lawrence took an active share in the great questions of reform, which divided the medical world as much as the political, and played the part alternately of an advocate and an opponent of innovation. He made many enemies, but continued to enhance his reputation as a surgeon and his position as a practitioner, and contributed many valuable works to the literature of his profession. He succeeded sir Benjamin Brodie as sergeant-surgeon to the queen, on which occasion he received his baronetcy. He died of paralysis at the age of 83, in Whitehall, on July 5, 1867. His writings, which are very numerous, are chiefly the following: *A Description of the Arteries of the Human Body, Reduced into the form of Tables*, translated from the Latin of Adolphus Murray, professor of anatomy at Upsal; *The Treatment of Hernia*; *An Introduction to Comparative Anatomy and Physiology, being the Introductory Lecture delivered at the Royal College of Surgeons in 1819*; *A Treatise on the Venereal Diseases of the Eye*; and *A Treatise on the Diseases of the Eye*, in general, etc. Of these works, the most important for his reputation and for the profession are those on the venereal diseases of the eye, and on hernia.

LAWRENCE, WILLIAM, b. Mt. Pleasant, Ohio, 1819; graduated at Franklin college, Ohio, in 1838, and at the Cincinnati law school in 1840. He resided successively at McConnellsburg and Bellefontaine, where he was successful in the practice of the law. At the latter place he edited the *Logan Gazette*, and, for a time, the *Western Law Monthly*. He also served successively in both branches of the state legislature, where he founded the reform school, and secured the passage of the free-banking law. From 1856 to 1864 he was a judge of the court of common pleas. He served for a time as col. of the 84th Ohio in the war of the rebellion, and was a member of congress from 1865 to 1871, and again in 1873-74. He edited vol. xx. of the *Ohio Reports*, and wrote a work on the *Ohio Civil Code*, and another on *The Law of Interest and Usury*.

LAWRENCE, WILLIAM PEACH, LL.D., b. N. Y., 1800; educated at Columbia college, and admitted to the bar in 1823. He was secretary of the American legation at London, 1826-28, and during a part of that time was chargé d'affaires. On his return to the United States he devoted himself to the practice of his profession, in which he attained high rank. He became a citizen of Rhode Island in 1850, and was elected lieut.gov. the next year. He has written several law-books, but is best known by his edition of Wheaton's *International Law*, which appeared in 1855. While in active practice at the bar he made a specialty of cases before the court of claims at Washington.

LAWRENCEBURG, a city of Indiana and the capital of Dearborn co., situated upon the Ohio river, 20 m. below Cincinnati, and upon the Ohio and Mississippi and the Indianapolis, Cincinnati, and Lafayette railroads. Pop. 3,159. It has 7 churches, 2 national banks, and 2 weekly newspapers, and is the center of a considerable trade. It is the terminus of the White Water canal, which affords excellent water-power. This place was the scene of some of Henry Ward Beecher's earliest ministerial labors.

LAWRENCE SCIENTIFIC SCHOOL. See HARVARD COLLEGE.

LAWRENCE, ST. See SAINT LAWRENCE, *ante*

LAWSON, JOHN, b. Scotland; visited America about 1700, and undertook the government survey of the Carolinas, which he conducted for a number of years. In 1712, while engaged in explorations to this end, in the company of baron De Graffenried, a Swiss, who was examining the country with a view of colonizing, he incurred the enmity of the natives, and both were captured. The baron was permitted to go free on paying a ransom, but Lawson was burned at the stake. He wrote *Journal of 1000 Miles' Travel among the Indians, with a Description of North Carolina* (Lond., 1700; republished in several editions; and translated into German, and published in Hamburg, 1722).

LAWSON, Sir WILFRID, b. 1829; a member of parliament for Carlisle, Eng.; has been prominent for his labors in the cause of total abstinence, and as the leader of the United Kingdom alliance. In 1864 he presented and advocated the permissive bill, which allowed two-thirds of the inhabitants of a parish or township to refuse to grant licenses for the sale of spirituous liquors. The bill was not passed.

LAW-TERMS. The usual law-terms in England and Ireland mean those periods of the year during which the law-courts sit in banc or in full court to dispose of business. These are of ancient origin, and are now fixed by statute as follows: Hilary term begins Jan. 11, ends Jan. 31; Easter term begins April 15, ends May 8; Trinity term begins May 22, ends June 12; Michaelmas term begins Nov. 2, ends Nov. 25. Though the courts always sit at those periods, yet they have a power of appointing sittings after term also, which power is always exercised for the dispatch of arrears of business. And the judges also practically sit nearly all the year round, disposing of business of one kind or another, except in the long vacation, which extends from Aug. 10 to Oct. 24. But even during that period also, one or more judges attend to perform incidental business; and it is only for some purposes, and for some kinds of business, that the long vacation acts as a suspension of hostilities.

In Scotland the law-terms are differently arranged. The court of session sits from Oct. 15 to Mar. 20, and from May 12 to July 18. But there, also, the judges are employed in other business during the intervals.

As to the quarter-days usual between landlord and tenant, see **LANDLORD AND TENANT**.

LAWYER, in the United Kingdom, is not a technical term of law, but a popular name given to those who are either practitioners of the law or intimately connected with its administration. In Great Britain and Ireland lawyers are subdivided into two classes. See **ATTORNEYS AND SOLICITORS, BARRISTERS, ADVOCATES**. In the United States an attorney acts as counsel, and *vice versa*, there being no similar subdivision of the profession, and the expediency of the subdivision has often been canvassed in the United Kingdom of late years.

LAWYER (*ante*). In the United States lawyers are called indifferently attorneys and counselors-at-law. Lawyers who devote themselves specially to patent causes are often called solicitors. Candidates for admission to the bar are required in most of the states to pursue a course of legal study either at a reputable law-school or in the office of some practitioner, and to pass a satisfactory examination before a court or before examiners appointed by a court for that purpose.

In England and Ireland lawyers are divided into attorneys, and advocates, counselors, or barristers; the duties of the former are to take charge of and prepare the suit for trial, those of the latter to give counsel regarding the suit and to conduct and argue it in court. A person applying for admission as an attorney must have been an apprentice for 5 years with some member of the bar, or for 3 years if the applicant has a degree from Oxford, Cambridge, or Trinity college, Dublin. The other class of lawyers, the advocates, counselors, or barristers, are called to the bar from the inns of court. An attorney practicing in a court of equity is called a solicitor; in an ecclesiastical or admiralty court, a proctor. The services of an English barrister are theoretically gratuitous, but he is paid by retainers. An English attorney or solicitor is paid according to a fixed system of fees.

In Scotland lawyers are divided into solicitors, advocates, and writers; and there is a privileged body of practitioners known as writers or clerks to the signet. A lawyer, being an officer of court, is bound to conduct himself properly in the suits on which he is retained, and on proof of misconduct or dishonesty in his profession, may be disbarred.

Lawyers are excused from serving on juries, and are exempt from arrest on civil process while in attendance upon court on professional business. The communications of a lawyer with his client are confidential, and a lawyer is protected by the law and cannot be compelled to disclose his client's secrets. In some states and territories, by recent enactment, women are made eligible for admission. For a more detailed account of the classes into which lawyers are divided in Great Britain see **ATTORNEY; ADVOCATE; BARRISTER; KING'S COUNSEL; WRITERS TO THE SIGNET**; *ante*.

LAY, BENJAMIN, 1681-1760; b. Colchester, England. He emigrated to Barbadoes in 1710, where his opposition to slavery subjected him to annoyance and persecution, which led to his removal to Abington, Penn. Slavery was then tolerated among the Quakers as well as others, and he became an agitator against it, uniting in this work with Anthony Benezet, Benjamin Franklin, and other eminent men. In 1817 he withdrew from the society of Friends as a testimony against it on account of its tolerance of slavery. He lived long enough to witness a great change of sentiment among the Quakers, but died 20 years before slavery was wholly exterminated from the society. In 1737 he wrote a tract, which Franklin printed, entitled, *All Slavekeepers that keep the Innocent in Bondage Apostates*. He carried his opposition to slavery so far as to manufacture his own clothing, in order to avoid the use of the products of slave labor. He opposed tea-drinking as injurious to health and a needless expense, and was very eccentric in some of his personal habits; but he was greatly respected for his sincerity and the spirit of self-sacrifice which he exhibited. Died at Abington, Penn.

LAY, HENRY CHAMPLIN, D.D., LL.D., b. at Richmond, Va., 1823; graduated at the university of Virginia in 1842, and subsequently at the theological seminary of the Episcopal church in that state; ordained deacon in 1846; was minister for a time in Lynn-haven parish, Va., but removed to the church of the Nativity, Huntsville, Ala., in 1847;

ordained priest in 1848; consecrated missionary bishop of the south-west in 1859, and transferred to the diocese of Easton in 1869.

LAYAMON, also **LAWEMAN**, author of the *Brut*, a metrical chronicle of Britain from the arrival of the fabulous Brutus to the death of king Cadwallader, 689 A.D., was, he himself tells us, a priest at Ernely, on the Severn, in Worcestershire, and appears to have flourished about the beginning of the 13th century. Nothing more is known concerning him. The value of the *Brut* is not so much literary as linguistic. It has no high pretensions to originality, being confessedly a compilation from Bede, St. Augustine (of England), St. Albin, and more particularly Wace, the Anglo-Norman poet, of whose *Brut d'Angleterre* it is in fact mainly an amplified translation. But Wace's performance is itself only a translation, with additions, from Geoffrey of Monmouth's Latin *Historia Brittonum*; and that again at least declares itself to be in turn a translation from a Welsh or Breton original (see **GEOFFREY OF MONMOUTH**). It will thus be seen that Layamon's work is only a third reproduction of a Celtic story; but in justice to the author it must be stated that his version is more poetical and dramatic than those of his predecessors. The great value of the poem, however, is, as we have said, linguistic rather than literary. It shows us the Anglo-Saxon changing or changed into early English, and a study of its peculiarities of grammar and phraseology enables us to trace the process by which the Saxon of Alfred and the chronicle became transformed into the English of Chaucer and Wycliffe. One curious and important fact is determined by it—viz., that 200 years after the Norman conquest, the use of words of French origin—so marked a feature of Chaucer's diction—had scarcely begun. In the 32,250 lines which the poem contains, there are not more than 50 such words. The versification is very arbitrary, exhibiting sometimes the alliteration of Anglo-Saxon, and sometimes the rhyme of French poetry. The work was edited (with a literal translation, notes, and a grammatical glossary) for the society of antiquaries of London by sir Fred. Madden (Lond. 3 vols. 1847).

LAYARD, **AUSTEN HENRY**, English traveler and diplomatist, was b. at Paris, Mar. 5, 1817. He was destined for the law, but finding the profession little congenial to his tastes, he set out on a course of Eastern travel, visited several districts of Asiatic Turkey, and became familiar with the manners and dialects of Persia and Arabia. On his first journey along the banks of the Tigris, in 1840, he was struck with the ruins at Nimrud—a village near the juncture of the Tigris and the Zab, pointed out by local tradition as the site of the original city of Nineveh—and felt an irresistible desire to examine the remains of the "birthplace of the wisdom of the west." In 1842, M. Botta, the French consul at Mosul, conducted some extensive excavations at that place, and Layard returning to the region, again directed his attention to Nimrud. It was 1845 before he could obtain the requisite means and facilities for his search, and he then, with the help of some Arabs, began secretly to dig in the mound supposed to contain the ruins. He soon came upon some sculptured remains, and became convinced that he had touched a rich vein of archaeological treasure. His excavations were resumed in 1846 and 1847, and his energy and perseverance were rewarded by the discovery of the ground remains of four distinct palatial edifices. The walls had been lined with large slabs of gypsum or alabaster, covered with bas-reliefs and cuneiform inscriptions. Many of these were sent to England by Layard, together with gigantic-winged human-headed bulls and lions, and eagle-headed deities. They were placed in the British Museum, of which they have since remained the chief attraction. Layard at first conducted his search at his own expense; he was, in 1845, liberally assisted by lord Stratford de Redcliffe, then British ambassador in Constantinople; and eventually, as the value of these specimens of Assyrian art began to be known, the house of commons voted a sum of £3,000, which was applied by the trustees of the British museum in continuing the excavations under Layard's superintendence. On his return to England he published a narrative of his explorations, under the title of *Niniveh and its Remains*, and another work entitled *Monuments of Niniveh*. He was presented with the freedom of the city of London, received the honor of D.C.L. from the university of Oxford, and was lord rector of Aberdeen university in 1855-56. In 1852 he became M.P. for Aylesbury, and in 1860 for Southwark; from 1861 till 1866 he was under-secretary of state for foreign affairs. In 1869 he went as British ambassador to Spain; and in 1877 he was sent to Constantinople at first as temporary, then as ordinary ambassador. His markedly philo-Turkish sympathies during and after the war provoked some comment at home. In 1878 the order of the bath was conferred on him.

LAYBACH. See **LAIBACH, ante.**

LAY BROTHERS, a class of uneducated persons in Roman Catholic convents who are devoted to the service of the monks, from whom they are distinguished by their dress and in whose stated religious services they are not required to join. Their vow binds them only to obedience and constancy. They were first employed, so far as appears, in the 11th century. In nunneries similar services are rendered to the nuns by lay sisters who are sometimes called sisters converse.

LAYCOCK, **THOMAS**, b. at Wetherby, Yorkshire, 1812; received his education at London, Paris, and Göttingen; in 1855 was appointed professor of the practice of physic and clinical medicine at Edinburgh; and in 1869 physician to the queen in Scotland.

He has given much attention to sanitary science, physiology, mesmerism, insanity, etc. Among his works are *The Nervous Diseases of Women; Mind and Brain, or the Correlations of Consciousness and Observation; and Methods of Medical Observation*.

LAY DAYS, a term of the maritime law denoting the number of days granted in the charter-party to the charterer or freighter of a vessel to load or unload in. Within the lay days no charge is made, but after their expiration a sum, stated in the charter-party, is charged and called demurrage. Lay days begin upon the arrival of the vessel at the usual place for discharging cargo. Sundays are counted in reckoning lay days, unless there be provisions to the contrary in the charter-party. See DEMURRAGE.

LAYING, or LAYERING, a mode of propagating trees, shrubs, and perennial herbaceous plants, which is very frequently employed by gardeners and nurserymen. It consists in bending and fastening a branch, so that a portion of it is imbedded in earth, there to throw out roots, the extremity being made to grow erect in order to form a new plant. The separation from the parent plant is not effected till the layer is sufficiently provided with roots. Any injury which prevents the free return of the sap greatly promotes the formation of roots, and a notch is therefore usually made in one side of the branch, at the place where the formation of roots is desired; it is also often a little split up from the notch; and sometimes a ring of bark is cut off, or a wire is twisted round it. The time which must elapse before the layer should be separated from the parent plant is very various; a few months being sufficient for some, and two years requisite for others. Many plants which can be propagated by cuttings are more easily and successfully propagated by layers.

LAYNEZ, or LAINEZ, DIEGO, 1512-65; b. Spain; educated at the high school of Alcala, and at the age of 19 years visited Paris, and became an ardent follower of Loyola. He accompanied the latter to Rome, where pope Paul III. appointed him a professor in the *Collegium de Sapienza*. Loyola died in 1556, and Laynez was elected general of the order of the Jesuits the following year. Offered a cardinal's hat, he refused it, designing to devote his life to the service of the new order. He represented it in the council of Trent; and there and elsewhere sustained by discussion and controversy his tenacious ideas in favor of the absolute infallibility of the pope. He laid the foundation at Venice of a college of Jesuits, and placed special stress on the importance of education which should influence the minds of the young for the good of the church. The ambitious nature of Laynez led him to advocate and practice craft and cunning in affairs, and he may be considered to have formed the order of the Jesuits on this principle, to which it has ever since adhered. Yet even Laynez, despite his zeal, fell under suspicion of the Spanish inquisition. He was the author of several theological writings, but none of these, save a few speeches, were ever printed.

LAZARISTS, an order of missionary priests originated in France by Vincent de Paul in 1624. Their chief function was to look after the religious interests of the country people and the lower classes. The new institution soon received the royal sanction, was officially approved in 1626 by the archbishop of Paris, and in 1632 was made by pope Urban VIII. a special religious society with the name of the *priests of the mission*, and Vincent was appointed by him its superior. They received also the same year from Adrien Le Bon, prior of St. Lazarus, the use of his priory, whence they were called Lazarists. As their primary object was to dispense religious instruction and assistance among the poorer classes of the rural districts of France, it was stipulated in the original deed of endowment that they should "neither preach nor administer any sacrament in cities which are the seats of bishops, archbishops, or of courts of justice, except in cases of extreme necessity." Besides their special work, they sought to reform the clergy by means of conferences and the establishment of seminaries. At first they lived in poverty and harmony without being subject to any laws; but in 1655 Alexander VII. confirmed their society, and prescribed a constitution, according to which for admission to the congregation one must have spent two years in a seminary, and must bind himself by the vows of poverty, chastity, and obedience, to care for the spiritual wants of the poor. Their dress is that of the secular clergy. During the lifetime of St. Vincent his disciples had visited nearly all the dioceses of France, and the missionaries had visited also Italy, Corsica, Poland, Ireland, Scotland, Algeria, Tunis, Madagascar. They were invited to Poland in 1651 by Maria Louisa, wife of king John Casimir II. During the French revolution the Lazarists suffered as all other religious organizations did, but were restored as early as 1804, and received from the public exchequer 15,000 francs, also a hospital in Paris for the establishment of a central institution and novitiate. Napoleon abolished the Lazarists in 1809, suppressed their houses, and confiscated their property. But in 1816 they were restored to their former position by Louis XVIII., and their seminary was transferred to a house in Rue Sèvres. In 1829 the pope appointed Pierre Dewailly superior-general. In 1862, according to P. Karl vom heil. Aloys, the Lazarists had 18 houses in France, 27 in Italy, 4 in the British isles, 6 in Germany, 3 in the Pyrenean peninsula, 10 in Poland; in Asia, they had establishments in Asiatic Turkey, Persia, Manilla, 5 provinces of China; in Africa, at Alexandria, Egypt, Algiers, Mustapha, Abyssinia; in America, 17 establishments. In 1874 the number of Lazarists in both hemispheres was estimated at 3,000.

LA'ZULITE, or **AZURITE**, a mineral long confounded with lapis lazuli (q.v.), but although somewhat similar in color, very different in composition; consisting chiefly of phosphoric acid and alumina, with magnesia and protoxide of iron. It occurs imbedded in quartz, or in fissures in clay-slate, in Styria, North Carolina, Brazil, etc.

LAZZARI, DONATO. See **BRAMANTE, ante.**

LAZZARONI, a name said to be derived from that of Lazarus in the parable, and until lately, designating a particular class of the inhabitants of Naples. They had no fixed habitations, regular occupation, or secure means of subsistence, but occasionally obtained employment as messengers, porters, boatmen, itinerant venders of food, etc. They have performed an important part in all the revolutions and movements in Naples for a long period, and in recent times have allied themselves to the cause of despotism. They were wont annually to elect a chief (*capo lazzaro*), who was formally recognized by the Neapolitan government, and who exercised an extraordinary power over them. Of late, they have lost many of their peculiarities, have come more within the pale of civilization, and, in fact, are no longer recognized as a separate class, though the name is still given to the boatmen and fishermen of the city, who are really the most industrious and best-principled of the Neapolitan populace.

LE, or **LEH**, the capital of Ladakh (q.v.) or middle Thibet, 2 m. to the n. of the upper Indus, in lat. $34^{\circ} 10'$ n., and long. $77^{\circ} 40'$ e., at an elevation of more than 11,500 ft. above the sea. Pop. variously estimated at from 4,000 to 10,000. Le is a main entrepot between Tartary and the Punjab, and for the shawl-wool of Thibet.

LEA, HENRY CHARLES, b. in Philadelphia, 1825; son of Isaac. He inherited his father's taste and aptitude for science, and when only 14 years of age wrote a valuable paper for *Silliman's Journal*. He devoted much time to the study of conchology, and published *Description of New Species of Shells*. At a later period he studied the organization of society in the middle ages, publishing *Superstition and Force: Essays on the Wager of Law, the Wager of Battle, the Ordeal and Torture; a Historical Sketch of Sacerdotal Celibacy in the Christian Church, and Studies in Church History; The Rise of the Temporal Power, Benefit of Clergy, and Excommunication*. Mr. Lea has long been at the head of the publishing house of Lea & Blanchard. He was prominent in patriotic service during the war of the Rebellion, has written much on political subjects, and is known to have been engaged upon a history of the inquisition, with special reference to America.

LEA, ISAAC, LL.D., b. at Wilmington, Del., 1792, of Quaker descent. In boyhood he entered upon a mercantile career, but his taste for natural history, especially geology, was so strong as to draw him aside from his original purpose. Devoting his spare time to his favorite studies, he early made large collections of fossils, minerals, and shells, and in 1815, when he was but 23 years of age, he was elected a member of the academy of natural sciences in Philadelphia, and began to contribute papers to its *Journal*. Marrying a daughter of Matthew Carey, he connected himself with the publishing house of which that eminent man was so long the head, and in 1827 began a remarkable series of papers upon fresh-water and land mollusks, which were continued for nearly 50 years, forming the materials for a great work upon American unionidæ. He was elected a member of the American philosophical society in 1828, and in 1858 was made president of the academy of natural sciences. He made a collection of unionidæ, the richest in the world, embracing nearly 10,000 specimens, and his papers, read chiefly before scientific associations in Philadelphia, numbered more than 150. He published *Contributions to Geology and Fossil Footmarks in the Red Sandstones of Pottsville*, and collected into 13 vols. his miscellaneous papers under the title of *Observations on the Genus Unio*.

LEA, MATHEW CAREY, b. Philadelphia, 1823: grandson of Matthew Carey; devoted himself to the study of chemistry, especially analytical. He has made important analyses, and is a recognized authority on photography, publishing, 868, *A Manual of Photography*.

LEA, THOMAS GIBSON, 1785-1844; b. Wilmington, Del.; brother of Isaac. He made a *Catalogue of Plants Collected near Cincinnati*, which was published in 1849 by the late Dr. W. S. Sullivant.

LEACH, WILLIAM ELFORD, 1790-1836; b. Plymouth, Eng.; in 1809 became a pupil of Dr. Abernethy at St. Bartholomew's hospital. Entering with enthusiasm into the study of zoölogy, he was appointed curator of the British museum. In 1813 he published a work on *Crustaceology*. He was the first to analyze the *Insecta* of Linnaeus into *Myriopoda, Arachnida, Insecta*, and *Crustacea*. He published a *Zoölogical Miscellany* in 3 vols., and began a *History of British Crustacea*; but an affection of the eyes compelled him to relinquish his work when only 17 numbers had appeared, and also to resign the post of curator.

LEACOCK, HAMBLE JAMES, 1795-1856; b. Cluff's Bay, Barbadoes; descended from a noble English ancestry. His father was a slaveholder in Barbadoes. The son received his early education at Codrington college, Barbadoes, became reader in his native parish, studied with his pastor, rev. W. M. Harte, and obtained deacon's orders in 1826.

While assistant priest of St. John's church he gave the privileges of the church to all the slaves of the parish, at the same time freeing his own slaves. This awakened so much opposition that the bishop removed him to St. Vincent, and then to Nevis. Difficulty with the bishop, insurrection of the slaves, and fall of property occurring, he removed to the United States, where he was settled in Kentucky and Tennessee. In 1840 he took charge of a small farm near New Brunswick, N. J., supplying churches in the vicinity. In 1841 and 1847 he revisited the West Indies, preaching vehemently against the prevailing vices. In 1855 he sailed for Africa as a missionary of the West Indian church association, and landed at Freetown, Sierra Leone. By the aid of the bishop and governor he founded the station, the Rio Pongas. From a converted negro chief he obtained a site for his dwelling and chapel; opened a school for boys, which was very successful. His health failing he went to Sierra Leone, but soon returned to his post, where he died. A large missionary field was opened as the result of his labors.

LEAD (symb. Pb., equiv. 103.7—new system, 207—spec. grav. 11.4) is a bluish-white metal of considerable brilliancy, which soon disappears on exposure to the air, owing to the formation of a thin film of oxide. It is so soft that it may be readily cut with a knife, or may be made to take impressions, and it leaves a streak upon paper. It may be cut or beaten into thin sheets, but in ductility and tenacity it is low in the scale of metals. It is readily fusible at a temperature of about 625° , and at a higher temperature it absorbs oxygen rapidly from the air, and the oxide thus formed volatilizes in the form of white fumes.

The combined action of air and water on lead is a subject of great practical importance, in consequence of the metal being so frequently employed in the construction of cisterns and water-pipes. The lead becomes oxidized at the surface, and the water dissolves the oxide; this solution absorbs the carbonic acid of the atmosphere, a film of hydrated oxycarbonate of lead ($\text{PbO}_2\text{HO} + \text{PbO}_2\text{CO}_2$) is deposited in silky scales, and a fresh portion of oxide of lead is formed and dissolved, and in this way a rapid corrosion of the metal ensues. This action is materially increased by the presence of some salts and diminished by the presence of other salts in the water. It is much increased by the occurrence of chlorides (which, as chloride of sodium, is often present in spring water), and of nitrates and nitrites (which are often present in spring and river waters, from the decomposition of organic matter); while it is diminished by the sulphates, phosphates, and carbonates, and especially by carbonate of lime, which is an extremely common impurity in spring water. In the latter case, a film of insoluble carbonate of lead is rapidly formed on the surface, and the metal beneath is thus protected from the action of the water. If, however, the water contain much carbonic acid, the carbonate of lead may be dissolved, and considering the dangers that arise from the use of water impregnated with lead, cisterns constructed of slate are far preferable to leaden ones.

Pure lead is of very rare occurrence. Almost all the lead of commerce is obtained from galena, the native sulphide of lead, by a process to be presently explained. The lead thus obtained is often *nearly* pure, and to obtain it *perfectly* pure it should be reduced with black flux from the oxide left by igniting the pure nitrate or carbonate.

The compounds of lead with oxygen are four in number—viz., a suboxide, Pb_2O , which is a black powder of no importance; a protoxide, PbO , which is the base of the ordinary salts of the metal; a binoxide, PbO_2 ; and red lead, which is a compound of the two last-named oxides, and is usually represented by the formula $2\text{PbO}\cdot\text{PbO}_2$. The protoxide is commonly known as *litharge*. It is obtained on a large scale by the oxidation of lead in a current of air, when it forms a scaly mass of a yellow or reddish tint. If the oxidation be effected at a temperature below that required for the fusion of oxide, a yellow powder, termed *massicot*, is obtained. Litharge is much used by the assayer (see ASSAY) as a flux; it enters largely into the composition of the glaze of common earthenware, and it is employed in pharmacy in the preparation of plasters. A mixture of 1 part of massicot with 10 of brickdust, made into a paste with linseed-oil, forms the compound known as *dil mastic*, which, from the hardness with which it sets, is frequently employed to repair defects in stone-facings.

The most important of the salts of the protoxide of lead are—1. The carbonate ($\text{PbO}\cdot\text{CO}_2$), which occurs native as a beautiful mineral in transparent needles or fibrous masses, and which is prepared under the name of *white lead* on a large scale as a pigment by a process to be subsequently described. The carbonate is insoluble in water; unless it is largely charged with carbonic acid. It is quickly blackened by exposure to hydrosulphuric acid (sulphureted hydrogen), either in the form of gas or in solution, and this is a serious drawback to the use of the lead salts as pigments. 2. The sulphate ($\text{PbO}\cdot\text{SO}_4$), which occurs native in white prismatic crystals, and is formed as a heavy white precipitate on adding sulphuric acid or a soluble sulphate to a soluble lead salt. 3. The nitrate ($\text{PbO}\cdot\text{NO}_3$), which is formed by dissolving lead or its protoxide in dilute nitric acid. 4. The chromates, of which the principal are the neutral chromate or *chrome yellow* ($\text{PbO}\cdot\text{CrO}_4$), and the dichromate or *orange chrome*. These are much used as pigments, and in calico-dyeing. 5. The acetates. The ordinary or neutral acetate ($\text{PbO}\cdot\text{C}_4\text{H}_3\text{O}_3 + 3\text{aq.}$) is prepared on a large scale by the solution of litharge in distilled vinegar, and evaporation, when the salt is obtained in four-sided prisms, or more commonly in a mass of confused minute white crystals, which at 212° lose their water of

crystallization. From its appearance, and from its sweetish taste, it derives its common name of *sugar of lead*. It is much used both in medicine and in the arts. Basic acetate of lead, regarded by some chemists as a diacetate, and by others as a triacetate, and commonly known as *Gouillard's extract*, is prepared by boiling a solution of sugar of lead with litharge, and adding alcohol, when the salt separates in minute transparent needles. It is the active ingredient of *Gouillard water*, which is imitated by the *liquor plumbi diacetatis dilutus*, and of *Gouillard's cerate*, which is imitated by the *ceratum plumbi compositum* of the London pharmacopeia.

The best tests for solutions of the salts of lead are the formation of a black sulphide with hydrosulphuric acid or hydrosulphate of ammonia, insoluble in an excess of the reagent; of a white insoluble sulphate with sulphuric acid, or a soluble sulphate; of a yellow chromate with chromate of potash; and a yellow iodide with iodide of potassium. All the salts of lead, insoluble in water, are soluble in a solution of potash. Before the blow-pipe on charcoal, the salts of lead yield a soft white bead of the metal, surrounded by a yellow ring of oxide.

Its use in Medicine.—The most important compound of lead in the *materia medica* is the *acetate of lead*, which is administered internally as an astringent and as a sedative. It is of service as an astringent, especially in combination with opium, in cases of mild English cholera, and even of Asiatic cholera, and in various forms of diarrhea. It will frequently check the purulent expectoration in phthisis, and the profuse secretion in bronchitis. In the various forms of hemorrhage—as from the lungs, stomach, bowels, or womb—it is employed partly with the view of diminishing the diameter of the bleeding vessels, and partly with the object of lowering the heart's action, and by these means to stop the bleeding. The ordinary dose is two or three grains, with half a grain of opium, in the form of a pill, repeated twice or thrice daily. If given for too long a time, symptoms of lead-poisoning (q.v.) will arise.

Mining, Smelting, etc.—Lead was largely worked by the Romans in Great Britain, and pigs with Latin inscriptions have been frequently found near old smelting-works. The mining of lead in England was formerly regulated by curious laws; some places, such as the King's Field, in Derbyshire, having special privileges. It was the custom in this district not to allow the ore to leave the mine till it was measured in the presence of an official called a *bar-master*, who set aside a 25th part as the king's cope or lot. Up to a comparatively recent period, persons were allowed to search for veins of the ore without being liable for any damage done to the soil or crops.

Lead ore is pretty generally distributed, but by far the largest supply of this metal is obtained from Great Britain and Spain, the former country yielding some 75,000 tons per annum, and the latter probably an equal supply. Nearly a fourth of the total British produce is procured from the Northumberland and Durham district, where there exists, at Allenheads, one of the largest mining establishments in the world. Scotland and Ireland furnish only a very small quantity.

With the exception of a little from the carbonate of lead, all the supplies of this metal are obtained from the sulphide of lead or galena (q.v.). The lead ore, when taken from the mine, is broken up into small pieces, "hotched," and washed, to separate impurities, by means of apparatus described under METALLURGY. Sulphide of lead, when tolerably pure, is smelted with comparative ease. It is first roasted in a reverberatory furnace. From 20 to 40 cwts. of galena are put into the furnace at a time, either with or without lime. In about two hours the charge becomes sufficiently roasted. During the process, the larger portion of the ore (PbS) takes up four equivalents of oxygen, and becomes sulphate of lead (PbO_2SO_4), a little oxide of lead (PbO) is also formed, while another portion remains unaltered as sulphide of lead. After it is roasted, the ore is thoroughly mixed together, and the heat of the furnace suddenly raised. This causes a reaction between the unchanged and the oxidized portion of the ore, and reduces much of the lead, sulphureous acid being at the same time evolved. In the third stage, lime is thrown in and mixed with slag and unreduced ore. When this becomes acted on, the whole of the lead is practically separated from the ore, and is then run off at the tap-hole.

In some districts, the roasted ore is smelted on a separate ore-hearth called the Scotch furnace, where the heat is urged by bellows. Peat and coal are used as the fuel. This is a slower mode of smelting than the last, but yields a purer lead.

During the operation of smelting, a considerable quantity of lead is volatilized, and carried off as *fume* or *smoke*, which, when allowed to escape into the atmosphere, not only involves a loss of lead, but destroys all vegetation for some distance around the works, and poisons cattle and other animals feeding near them. Much attention has of late been paid to the obviating of these evils, and several plans are in use for the purpose. Where it can be done, no method is more effective than simply conducting the smoke from the furnaces through a long horizontal flue—say a mile in length—to a vertical stack. The fume condenses on the sides, certain openings being left for the purpose of collecting it. About 33 per cent of the fume thus recovered consists of metallic lead.

When lead contains antimony and tin as impurities, they are separated by fusing the metal in shallow pans, and allowing it to oxidize at the surface. In this way, the antimony and tin form oxides, and as such are skimmed off. Lead reduced from galena always contains a little silver, of which 8 or 10 ounces to the ton is a very common pro-

portion, although it often exists in much larger quantity. The separation of this silver is now greatly facilitated by means of a desilverizing process patented by the late Mr. H. Pattinson of Newcastle-on-Tyne. It consists in melting the lead, and allowing it to cool slowly, at the same time briskly stirring the melted mass. A portion of the lead is thus made to crystallize in small grains, which, as pure lead solidifies at a lower temperature than when alloyed with silver, leaves the uncryallized portion richer in silver. In this operation, a row of, say, nine cast-iron pots are used. They are usually about 6 ft. in diameter, and each heated with a fire below. The lead from the smelting furnace is treated as above in the middle pot, from which the poorer crystallized portion is ladled with a strainer into the first pot on the right, and the richer portion, which remains liquid, is removed to the first pot on the left. With both kinds the process is several times repeated—the one becoming poorer and the other richer in silver every time, till the lead in the pot on the extreme right has had its silver almost entirely removed, and that in the pot on the extreme left contains about 300 ounces of silver to the ton. The silver is then obtained from this rich lead by melting it on a flat bone-ash cupel, placed in a reverberatory furnace, and exposing it to a current of air which reduces the lead to the oxide or *litharge* of commerce, leaving the silver on the cupel. Fully 600,000 ounces of silver are in this way annually separated from British lead, the latter at the same time being improved in quality.

Lead is an important metal in the arts. Rolled out into sheets, it is largely used for roofing houses, for water-cisterns, and for water-pipes. It is also of great service in the construction of large chambers for the manufacture of sulphuric acid. Its value for the manufacture of shot is well known. Alloyed with antimony, etc., it is largely consumed for type-metal, and with tin for solder. Much lead is also required for the manufacture of pewter, Britannia metal, etc. See ALLOY.

Of the compounds of lead other than alloys which occur largely in commerce, the following are the principal:

White Lead or *Carbonate of Lead*, a substance very extensively used as white paint, and also to form a body for other colors in painting. As much as 16,000 tons of it are annually made in England. White lead is still largely made by the old Dutch process, which consists in treating metallic lead, cast in the form of stars or gratings, in such a way as to facilitate the absorption of carbonic acid. These stars of lead placed in earthenware vessels, like flower-pots, containing a little weak acetic acid, are built up in tiers in the form of a stack, and surrounded with spent tan or horse-dung. The heat given out from the dung volatilizes the acid, which, along with the air, oxidizes the lead. The acetic acid changes the oxide into the acetate of lead, and this is, in turn, converted into the carbonate by the carbonic acid given off from the hotbed. By this process, metallic lead requires from 6 to 8 weeks for its conversion into white lead. Several less tedious processes for the manufacture of a white paint from lead have been tried at various times, but the only one now practiced is that for the production of an oxychloride of lead, by acting on raw galena with hydrochloric acid.

Minium, Red Lead, or Red Oxide of Lead, is much consumed in the manufacture of flint-glass and porcelain, and to some extent as a pigment. It requires to be made of very pure lead, as a slight trace of copper would impart a color to glass. Minium is prepared by heating *massicot* or protoxide of lead to a temperature of 600° F. in iron trays, in a reverberatory furnace, carefully avoiding fusion. More oxygen is thus gradually absorbed; and a compound of the protoxide and the peroxide of lead is formed, having a bright red color, which is the red lead of commerce.—*Litharge* has been already noticed.

LEAD, THE, used on shipboard, for ascertaining the depth of water, consists of a piece of lead shaped like an elongated clock-weight, attached to a line of about 20 fathoms. The lower part of the lead is scooped out, and filled with tallow, that portions of the bottom may adhere. The *deep-sea lead* weighs from 25 to 30 lbs., and is attached to a line of far greater length.

LEADER, the name given to the performer in an orchestra who plays the principal first-violin.

LEADING NOTE (Fr. *note sensible*), in music, is usually understood to mean the sharp seventh of the diatonic scale, or the semitone below the octave, to which it leads. The most of the German theorists have now relinquished the term leading note, as every note, when it is felt that another immediately above or below it should follow, may be said to be a leading note.

LEADING QUESTION is a technical expression in law to denote a question so put to a witness as to suggest the answer that is desired or expected. Thus, if a witness is asked "Was he dressed in a black coat?" it is supposed the witness will answer, yes; whereas the proper way of putting the question is: "How was he dressed?" or, "What kind of coat?" etc. The rule established in courts of justice as to the correct practice in such matters is that when a witness is examined in chief, i.e., by the party who adduces such witness, leading questions are not allowed, except in one or two rare cases; whereas, when the witness is cross-examined, i.e., by the opposing party, leading questions may be put; for the object is to make the witness contradict and stultify himself, so that

the jury will disbelieve him. The above rule, however, only applies to material questions, for in immaterial questions leading questions may be put, so as to save time.

LEAD PLASTER. See **DIACHYLON, ante.**

LEAD-POISONING. Persons whose system becomes impregnated with lead, as, for example, painters, who are constantly handling white lead, or persons who for a length of time have been using water charged with a lead-salt, exhibit a series of phenomena of lead or saturnine poisoning.

The early phenomena, which constitute what Tanquerel des Planches, the highest authority on this subject, terms *primitive saturnine intoxication*, are (1), a narrow blue line, due to the presence of sulphide of lead, on the margin of the guins next the teeth; (2), a peculiar taste in the mouth, and a peculiar odor of the breath; (3), a jaundiced state of the skin, with more or less emaciation; (4), a depressed state of the circulation.

These premonitory phenomena are followed, unless remedial means are adopted, by the four following forms of disease, each of which may exist alone, or may be complicated with one or more of the others, or may follow the others, without, however, having any definite order of succession:

1. LEAD COLIC, which is by far the most frequent of the diseases.
2. LEAD RHEUMATISM OR ARTHRALGIA, which in frequency is next to colic.
3. LEAD PALSY OR PARALYSIS, which may affect either motion or sensation, and is next in frequency.
4. DISEASE OF THE BRAIN, which is the least common of all the forms of lead-poisoning, and is manifested by delirium, by coma, or by convulsions.

Lead Colic is characterized by sharp continuous abdominal pains, which are usually diminished on pressure; by hardness and depression of the abdominal walls; by obstinate constipation, slowness and hardness of the pulse, and general disturbance of the system. The blue line on the gums serves at once to distinguish it from other varieties of colic.

Lead Rheumatism is characterized by sharp pains in the limbs, unaccompanied by redness or swelling, diminished by pressure, increased by motion, and accompanied by cramps, with hardness and tension of the affected parts. It is distinguished from similar affections by the blue line on the gums.

Lead Palsy is characterized by a loss of voluntary power over certain muscles. It more commonly affects the upper than the lower extremity, and the muscles most frequently affected are those of the ball of the thumb and the extensors of the wrist.

The Treatment.—The patient should be placed in a sulphureted bath, which converts all the lead-salts on the skin into the inert black sulphide of lead. These baths should be repeated till they cease to cause any coloration of the skin. At the same time he should drink water acidulated with sulphuric acid, or a solution of sulphate of magnesia, with a slight excess of sulphuric acid, by which means an insoluble sulphate of lead is formed, which is eliminated by the purgative action of the excess of sulphate of magnesia. Iodide of potassium is then administered, which acts by dissolving the lead out of the tissues, and allowing it to be removed by the urine.

The palsy may be specially treated, after the elimination of the lead, by electricity, and by strychnine in minute doses.

Persons exposed from their occupation to the risk of lead-poisoning should be especially attentive to cleanliness; and if they combine the frequent application of the warm bath with the use of sulphuric lemonade or treacle beer acidulated with sulphuric acid, as a drink, they may escape the effects of the metallic poison.

LEADVILLE, a t. in Colorado; pop. 25,000; situated 170 m. from Denver, on the Denver, South Park and Pacific railroad, in southern Colorado, at an altitude of several thousand feet above the sea-level; the center of an extensive and important silver-mining region. The origin and growth of Leadville are extraordinary instances of the rapidity with which unity of interest will populate a neighborhood, however difficult may be the migration and settlement. In 1877 the site of the town of Leadville was a valley covered with sage-brush, and possessing only about 25 inhabitants. In the short period of two years this was transformed into a thriving, active city of as many thousands, from which poured forth daily an amount of wealth probably never before equaled by any community. The discovery of the remarkable deposit of silver in the hills about Leadville was made in 1877, by Messrs. Stevens and Wood, two prospectors who were engaged in gold-washing in California gulch, about 4 m. from the present Leadville. The discovery was made through the prevalence of a peculiar kind of stone, which, by getting into and choking their sluice-boxes, impeded the work of the miners. The attention of Mr. Wood was at length directed towards the examination of these stones, when he found that besides containing a large proportion of lead—which did not pay to work, on account of the distance of a market and the cost of transportation—they held also a small percentage of chloride of silver. Mr. Stevens followed up this analysis and discovery by tracing the fragments to their outcrop, and there locating a mine; and in the winter of 1877-78 he began working what was afterwards known as the Iron mine, and which was the first worked of the Leadville properties. The eminence containing the claims which made up this mine was called Iron hill, and its discovery was speedily followed by that of the Carbonate hill mines, which were soon developed, both these localities displaying extraordinary richness. Succeeding discoveries were made on

Fryer, Evans, and Long and Derry hills, all of these forming a part of the Mosquito range, whose different heights vary between 10,000 and 14,000 ft. above the sea-level, and which lie along the e. of the Arkansas river valley. These hills have been mined very thoroughly. The geological structure of the deposit has not been authoritatively surveyed, but in a general way it may be said to comprise—1, granite; 2, schistose rocks; 3, quartzite; 4, lime; 5, porphyritic trachyte; 6, drift; the mineral being found between the fourth and fifth strata, the floor being limestone and the roof porphyry. The ore contains—1, various oxides of iron and manganese; 2, carbonate of lead and galena; 3, chloride of silver, in small particles, and mixed mechanically, not chemically, with the other minerals. The proportion of silver has been found to vary between a trace and 2,000 to 3,000 oz. to the ton. The average yield has been from 100 to 150 oz. to the ton, though certain mines have assayed 300 to 400 ounces. The carbonate ores have been found the richest in silver, these being divided into hard and sand carbonates—the former hard gray rocks, having a metallic luster when broken; the latter the same in process of disintegration. The silver ore is found in what is known as a "contact vein," varying from a line to 20 or 30 ft. in thickness. There are no "true fissure" veins in this region. The veins dip at an angle of 15 or 20 ft., the richest deposits of silver occurring generally in depressions. The mines on Fryer hill proved to be perhaps the richest of any up to 1880. They included the Little Pittsburg group, New Discovery, Vulture, Chrysolite, and Carboniferous, all of which became well known, and celebrated for their yield. The number of productive mines which had been worked up the midsummer of 1879 was about 60. Smelting works had been set up which were run by independent companies, and 2 sampling establishments, where the ore was assayed for the purpose of affixing the average as a basis of value. The exceptional character of the settlement of Leadville in the first two years of its history, was, not unreasonably, expected to operate unfavorably on the health of the population. Here was an unusually rapid and extensive accumulation of humanity drawn from almost every portion of the continent, and increasing at the rate of 2,000 souls per month, for which no adequate provision could, at the outset, have been made. Rude and flimsy structures of rough boards were hastily thrown together, into which were crowded as many as they would hold of the miners, adventurers, prospectors, gamblers, and others who had made up the enormous emigration from the east to Leadville. In the city the disregard of the commonest sanitary provisions seemed to invite mortality. There was no drainage; the back lots and alleys were made the receptacle of the city's accumulation of waste and garbage; and irregular hours and the generally unsettled condition of life in a great mining district presented their most threatening aspect. Yet, despite all these disadvantages, and doubtless owing, in the main, to the extreme rarefaction of the atmosphere at such an elevation, the death-rate of Leadville, in a population of 9,000, was only 2 per cent, and one-fourth of this resulted from violence. But the constant accessions of population soon brought about a better condition in the structure of the city. Land within the limits increased in value so that lots which sold for \$200 and \$300, at the beginning of the settlement, increased in value to ten times those figures. Well-built stores and residences were erected, churches were built, 3 daily newspapers were established, and Leadville became a city of business importance, well policed, and comparatively orderly. The completion of the railroad to this point not only afforded facilities for passenger transportation at reasonable rates—thus increasing immigration and settlement—but accomplished a most important improvement in the mining industry by rendering it practicable to ship low-grade ores at a profit. The development of mining claims, while resulting in the production of a vast amount of ore, which brought handsome returns, and made it practicable for fortunate companies to pay large dividends, was followed by the usual speculative fever. Companies were formed with enormous capital (on paper), their stock being sold in the eastern markets at one-tenth or one-twentieth their par value. In many instances the mining properties represented by such stock were never worked; in others, the dividends were paid out of the capital, and the stock "watered" to an enormous amount. Stocks which sold readily in the spring and summer of 1879 at \$18 and \$20 per share, went down to a few cents, or vanished altogether from the list. Mining exchanges were established in New York and Boston, the most of the business being done in the former city, and the larger number of the companies representing the Leadville mines having their offices there. The number of Leadville companies reported in Jan., 1881, was 12, representing \$72,000,000, the par value of most of the stocks being \$10, though some were held at \$20, and \$100 per share was the par value in at least one instance. The mining-stock market witnessed a serious decline in values at the close of the year 1880, the result of over-speculation and want of confidence. Some of the Leadville mines which had been the most successfully worked gave out; others were badly managed and sunk under financial embarrassment. During the year a serious strike of miners in Leadville, necessitating armed interference on the part of the authorities in the interest of the public peace, served still further to disturb the successful progress of the speculative interests of that section. The effervescence of a wide-spread popular excitement which had lasted for nearly three years had subsided, and the Leadville mining industry was gradually settling to a basis of industrial certainty, firmly established on the unquestionable and remarkable mineral resources of the district. The output of ore of

the Leadville mines during 1880, according to the smelters' returns, amounted to 238,000 tons, producing bullion valued at \$15,287,936, or an average yield of \$61.68 per ton.

LEAF. See LEAVES, *ante*.

LEAF-CUTTER BEE, a name given to certain species of *solitary bees* (see BEE) of the genera *megachile* and *osmia*, in consequence of their habit of lining their nests with portions of leaves, or of the petals of flowers, which they cut out for this purpose with the mandibles. *Megachile centuncularis*, a common British species, uses the leaves—not the petals—of roses, fitting the pieces together so as to form one thimble-shaped cell within another, in a long cylindrical burrow, the bottom of each cell containing an egg and a little pollen paste. The structure of these nests is very nice and curious.

LEAF-INSECT, or WALKING-LEAF (*phyllium*), a very remarkable genus of orthopterous insects, of the family *phasmidae* (q.v.), natives of tropical countries, having wings extremely like leaves, not only in color, but in the way in which they are ribbed and veined. The joints of the legs are also expanded in a leaf-like manner. These insects spend their lives among leaves, move slowly, and would be much exposed to every enemy, did not their leaf-like appearance preserve them from observation.

LEAF-ROLLERS, a family (*tortricidae*) of small nocturnal lepidopterous insects (moths) which in the larva state roll themselves within the leaves of plants, fastening them with silken threads. They are generally less than an inch in breadth across the expanded wings, having naked antennæ. The fore wings are usually marked with spots and bands, but the hind wings are without ornament. These insects are very injurious to vegetation. The genera and species are very numerous.

LEAGUE (from the Lat. *lēga*), a measure of length of great antiquity. It was used by the Romans, who derived it from the Gauls, and estimated it as equivalent to 1500 Roman paces, or 1.376 modern English miles. The league was introduced into England by the Normans, probably before the battle of Hastings (1066), and had been by this time lengthened to 2 English m. of that time, or $2\frac{9}{10}$ modern English miles. At the present day, the league is a nautical measure, and signifies the 20th part of a degree—i.e., 3 geographical miles, or 3.456 statute miles. The French and other nations use the same nautical league, but the former nation had (until the introduction of the metrical system) two land-measures of the same name, the legal posting-league = 2.42 Eng. miles, and the league of 25 to the degree, which is = 2.76 statute miles.

LEAGUE, the term generally employed in the 16th and 17th centuries to designate a political alliance or coalition. The most famous leagues were those of Cambrai, Schmalkald, Nürnberg, etc. But the name has a peculiar importance in the history of France, as applied to the opposition organized by the duke of Guise (q.v.) to the granting of the free exercise of their religion and political rights to the Huguenots. This league, known as the holy league (*Sainte Ligue*), was formed at Péronne, in 1576, for the maintenance of the Roman Catholic religion in its predominance; but the object of the Guises was rather to exclude the Protestant princes of the blood from the succession to the throne. For an account of the civil war that ensued, see HENRY III., HENRY IV., and GUISE.—See Mignet, *Histoire de la Ligue* (5 vols., Par. 1829).

LEAGUE, ACHÆAN. See ACHAIA, *ante*.

LEAGUE, ANTI-CORN LAW. See ANTI-CORN LAW LEAGUE, *ante*.

LEAKE, a co. in central Mississippi, intersected by Pearl river and its affluents; about 600 sq.m.; pop. '80, 13,147; surface undulating and covered extensively with forests; chief productions, cotton, corn, and pork; valuation of real and personal property, \$1,299,698. Capital, Carthage.

LEAKE, Sir JOHN, Admiral; 1656-1720; b. Rotherhithe, Surrey, England; early entered the navy, and distinguished himself under his father in 1673 in the action between sir Edward Spragg and Van Tromp, and afterward, when appointed capt., performed the daring feat of conveying some victualers into Londonderry, thus compelling the enemy to raise the siege. In 1702 he was promoted to the rank of commodore, and, in command of a squadron, destroyed the French settlements at Newfoundland, restoring the island to the English. For these services he was made on his return rear admiral, and soon afterward vice-admiral of the blue, and knighted. In 1704 he displayed great skill and gallantry in relieving Gibraltar when on the point of being taken by 500 Spaniards who had climbed up the rock. Soon after he was made vice-admiral of the white, and again, in 1705, relieved Gibraltar by destroying the French squadron. In 1706 he relieved Barcelona when besieged by the Spaniards and French and in great extremity, obliging king Philip to raise the siege. In the same year he commanded the fleet which captured Alicant, Carthagena, and the island and city of Majorca. On returning home he received for his services a ring valued at £400 from prince George of Denmark, and £1000 from the queen. In 1707 he was made admiral of the white and commander-in-chief of the fleet. In 1708 he captured Sardinia and Minorca. In 1709 he was made rear-admiral of Great Britain. The same year he was lord of the admiralty, and continued high in office till the death of queen Anne. He was several times a member of parliament for Rochester. On the accession

of George I. he was superseded on a pension of £600 a year, and spent the remainder of his life in retirement, leaving a reputation for great skill, energy, prudence, and success.

LEAKE, WILLIAM MARTIN, a lieut.col. in the British army, and a traveler who has contributed much to our knowledge of the ancient and modern geography, history, and antiquities of Greece. He was born in 1777, and died Jan. 6, 1860. With remarkable critical acuteness and soundness of judgment he combined great learning and an admirable power of clear statement. His principal works, containing the matured fruit of his observations and studies, are *Researches in Greece*, etc. (1814); *The Topography of Athens*, etc. (1821); *Journal of a Tour in Asia Minor, with Comparative Remarks on the Ancient and Modern Geography of that Country* (1824); *Travels in the Morea* (1830); *Travels in Northern Greece* (1835); and *Numismatic Hellenica* (1854).

LEAMING, JEREMIAH, D.D., 1719-1804; b. Middletown, Conn.; graduated at Yale in 1745; ordained to the Episcopal ministry in 1748. He was settled at Newport, R. I., 8 years, at Norwalk, Conn., 21 years, and at Stratford 8 years. In the revolutionary war he was imprisoned for his tory sentiments, and while thus confined contracted a disease of the hip that made him a cripple, on which account he declined in 1783 an election as first bishop of the American Episcopal church. Among his works were a *Defense of the Episcopal Government of the Church*; *Evidences of the Truth of Christianity*; and *Discussions on Various Subjects*. Died at New Haven.

LEAMINGTON, a fashionable watering-place in the county of Warwick, England, and one of the handsomest towns in the country, is beautifully situated on the Leam, a tributary of the Avon, about 2 m. from Warwick. It contains public gardens, a proprietary college erected in 1847 in the Tudor style, and other institutions. In the center of the town is a pump room, a handsome structure. Leamington is wholly of modern growth, having become important only within the present century. Its mineral waters are saline, sulphureous, and chalybeate. The watering season lasts from Oct. till May. The town stands in the center of a fine hunting country, and is much resorted to by lovers of the chase. Pop. in '71, 20,910.

LEANDER. See HERO, ante.

LEAPING-FISH, *Salarias tridactylus*, a curious little fish of the blenny family, abounding on the coast of Ceylon, and remarkable for leaving the water to visit every place washed by the surf. By the aid of the pectoral and ventral fins and the gill-covers, it moves across the damp sand, ascends the roots of mangroves, and runs up wet rocks in quest of flies. "These little creatures are so nimble," says sir J. E. Ten-tent, "that it is almost impossible to lay hold of them, as they scramble to the edge and plunge into the sea on the slightest attempt to molest them." They are 3 or 4 in. long, and of a dark brown color.

LEAP-YEAR, a year of 366 days (see CALENDAR), so called because it leaps forward a day as compared with an ordinary year. It so happens that the leap-years coincide with the years that are divisible by four, and thus they may be known. Of the years concluding centuries, only every fourth is a leap-year, beginning with 2000, which is divisible by 400, as is also 2400, etc. The term *bissextile*, applied by the Romans to leap-year, arose from their reckoning the 6th before the calends of Mar. (Feb. 24) twice (*bis*), whereas we add a day to the end of the month, making Feb. 29.

LEAR, TOBIAS, 1762-1816; b. Portsmouth, N. H.; graduated at Harvard in 1783. In 1785 he became the private secretary of Washington; was appointed consul-general at Santa Domingo in 1802, and at Algiers in 1804; in 1805 was appointed commissioner to negotiate peace with Tripoli. Having discharged this duty, he returned to Washington and accepted an appointment as accountant in the war department.

LEAR'CHUS, a Greek sculptor of renown, who is said to have lived in Rhegium, in the s. of Italy, at a period prior to 620 B.C. He is reputed to have made a statue of Jupiter in bronze, which was seen at Sparta, and was regarded as the most ancient work of its kind. It was formed from separate pieces which were adjusted in their proper relative positions by means of hooks and nails, with a view to the possible separation of the parts when necessary.

LEARNED, EBENEZER, about 1728-1801; b. in Mass.; served as capt. in the French war from 1756 to 1763; raised a regiment in Massachusetts at the beginning of the revolutionary war; was raised to the rank of brig.gen. in 1777, and assisted in the relief of fort Schuyler in Aug. of that year. He took a prominent part in the battle of Still-water, and was at Valley Forge in the winter of 1778-79, and on account of broken health was compelled to resign in the spring. Congress voted him a pension in 1795. Died at Oxford, Mass.

LEASE is the contract establishing the relation between landlord and tenant (q.v.). If the term of years is more than three, then it must be by deed under seal in England, or by writing in Scotland, if for more than one year. An improving lease is where the lessee agrees to keep the premises in repair. A building lease is where the tenant intends to build a house on the land. See BUILDING LEASE, also GROUND-RENT.

The granting of leases to those holding land from the owners has been general in Scotland for more than a century. To this is, no doubt, to be ascribed, to a great

extent, the rapid progress which improvements in farming have made in the north within that period. The length of leases in Scotland is commonly nineteen years. Recently, in pastoral farms, where no rotation of crops is required, and no substantial improvement expected, short leases of seven or ten years have come into use. What we have to notice in particular is the common agricultural lease of nineteen years, which forms the great base of rural prosperity. During the currency of this species of lease, the tenant has in a great measure the uncontrolled possession of the land, and this lengthened term enables him to reap the benefits of improvements or money expended. Leases on the Scotch system are now becoming more general both in England and Ireland. No doubt holding land from year to year has wrought well in some parts of England, where large capitals are invested in the land by tenants who have no other security than the good faith and feeling between themselves and landlords. In Scotland, however, the system of leases alone meets the tastes and genius of farming. A lease should be clearly and concisely written, so that the terms may be well understood by both parties, and all disputes at its expiry avoided. The cropping clauses of leases vary with the localities. In the neighborhood of towns the tenant is usually allowed to sell the whole produce, including the straw, but is bound to bring back manure to make up the waste. In inland parts, on the other hand, where the selling of the straw year after year might impoverish the soil, it is customary to restrict tenants from so doing. It is also common to debar tenants from selling turnips. Both these clauses cannot be considered as any hardship to improving tenants. The raising and selling of potatoes off the land should not be restricted. In the best arable districts, tenants are often bound not to take two white crops in succession. This is, perhaps, a good enough rule to be applied to light lands, but in other cases barley might be allowed to be taken after wheat. All farmers should be allowed to grow peas to a certain extent, but not more than the twentieth part of the land under regular cultivation. The cropping clauses should be framed in accordance with the systems prevailing in the neighborhood. Whatever these are, they should be clearly defined. No such clauses as "farming according to the rules of good husbandry" should be allowed, as this is apt to lead to a disagreement in defining what these rules are. The terms of entry are usually Whitsunday and Martinmas, which require very different arrangements in the terms of leases. In drawing up these, the most experienced farmers of their respective districts should be consulted, and the terms framed, as far as possible, to encourage the free application of capital to land, and at the same time to avoid the deterioration of the land at the expiry of the term.

The following are the usual clauses in an agricultural lease, viz.: 1. Landlord lets lands specified for term of years, excluding assignees and sub-tenants. 2. Reserves mines, etc., with power to work them; power to excamb, plant, alter, and make roads, hunt, shoot, and fish, cut and carry away trees, feu part of lands for building purposes, inspect farm, etc. When exercise of reservations causes surface damage, this to be paid for. 3. Clause of warrandice. 4. Assignment to obligation of previous tenant to leave premises in order. 5. Specific details as to additional houses and fences required. 6. Obligation on tenant to pay rent specified at two terms. 7. To maintain and leave fences in good repair. 8. To insure houses against damage by fire. 9. Cropping clause regulating cultivation of lands, and manner in which they are to be left; and also disposal of waygoing crop, manure, fallow-break, etc. 10. Arbitration clause for settlement of disputes. 11. Obligation to remove at expiration of lease. 12. General obligatory clause. 13. Clause of registration. And 14. Testing clause.

Every lease has its own peculiar details in reference to drainage, houses, and cropping. When a tenant enters without paying for the straw or manure, it is called "steelbow," and he receives no value for these when he leaves. Occasionally rents are paid wholly or in part by the current price of grain, a quantity of grain being fixed, convertible at the average market price of the season, as determined by a jury before the sheriff in a court called the fairs court. In consequence of the preciseness in which Scotch leases are drawn up, disputes are of rare occurrence. It will, of course, be understood that such leases can only be brought into operation where landlords are able and willing to put farms thoroughly in order for the tenant, and where the tenant possesses sufficient capital to work the farm advantageously.

LEASE AND RELEASE, a name given to a conveyance of land formerly much used in England, but now superseded by a grant.

LEASEHOLD. A leasehold estate is merely the interest or property which a man has who holds a lease; and he is also sometimes called a leaseholder. A leasehold estate is of much less value than a freehold estate, for a lease must some time or other come to an end, whereas a freehold estate is held by a man and his heirs forever—that is, until he or they choose to part with it. See **LANDLORD AND TENANT**.

LEASH, in falconry, the thong of leather by which a hawk is held. The word also signifies a line affixed to the collar of a greyhound, and is used in both significations in heraldry.

LEASING-MAKING, in Scotch law, means seditious words, which constituted an offense punishable with death by ancient statutes of 1584 and 1585. The punishment

was afterwards mitigated to fine and imprisonment, or both, at the discretion of the court.

LEATHER consists essentially of the skins of animals chemically altered by the vegetable principle called tannin, or tannic acid (q.v.), so as to arrest that proneness to decompose which is characteristic of soft animal substances. Its invention reaches beyond the dawn of history, and was probably among the earliest germs of civilization; for as the skins of animals would naturally be among the first articles of clothing, any means of preserving them more effectually than by drying would be highly prized. The discovery that bark had this effect was doubtless the result of accident. The principle of its action was unknown up the present century; and the same unvarying method had been employed from the earliest times until the last few years, when the invention of new processes has much facilitated the manufacture.

The skins of all animals used in the production of leather consist chiefly of gelatine, a substance which easily enters into chemical combination with the tannic acid found in the bark of most kinds of trees, and forms what may be termed an insoluble *tanno-gelatin*. This is the whole theory of tanning, or converting the skins of animals into leather. Formerly, oak-bark was supposed to be the only tanning material of any value; but lately very numerous additions have been made to this branch of economic botany.

In addition to the process of tanning in making leather, there are other modes, one of which is *tawing*, another *dressing in oil*. The following are the skins which form the staple of our leather manufacture: ox, cow, calf and kip, buffalo, horse, sheep, lamb, goat, kid, deer, dog, seal, and hog.

The term *pelt* is applied to all skins before they are converted into leather. When simply made into leather in the state we find in shoe-soles, it is called "rough leather;" but if, in addition, it is submitted to the process called currying, which will be hereafter described, it is termed "dressed leather."

The following trade-terms are in general use: hides or crop-hides, butts and backs, bends, offal, and skins. The complete hide when rounded, with the cheeks, shanks, and belly-pieces, etc., pared off, is called a *butt*; the pieces cut off constitute the *offal*; and *skins* are all the lighter forms of leather, such as sheep, goat, deer, etc.

Besides the ox and cow hides furnished by the home-trade, vast numbers are imported from Montevideo, Buenos Ayres, Russia, and northern Germany, and a very considerable number of dry buffalo-hides are brought from the East Indies. The quantity of all sorts imported into Great Britain in 1875 amounted to 1,027,953 cwt.; and the entire value of the hides and leather (unmanufactured) imported in 1875 was as much as £4,852,030. These returns, however, comprise a considerable number of horse-hides, which are also sent from South America. Calf-skins and kip-skins (that is, the skins of beasts older than calves, but not full-grown oxen) are, when tanned, used chiefly for the upper-leather of boots and shoes.

Sheep and lamb skins are imported (in the wool) in large quantities from Australia and the cape of Good Hope; and tanned, from our East Indian possessions. The latter, with the cape skins, are used for book-binding, furniture, gloves, etc. Lamb-skins are imported also from Italy, Sicily, and Spain, and tawed and dyed for making gloves, in imitation of kid. A great portion of all sorts of lambs and sheep are tawed and used for masons' aprons, sewing harness, plaster-skins, tying up bottles, lining shoes, and other jobbing and inferior purposes.

Deer-skins are dressed by the oil process, and form a great portion of the so-called *shamoy* leather, which derives its name from the chamois of the Alps, from the skin of which it was formerly made.

Dog-skins are tanned or tawed for gloves, and for thin shoes and boots. *Seal-skins* are manufactured into the so-called "patent leather," by varnishing their upper surface. The manufacture of this kind of leather has of late become of great importance to the London, Edinburgh, and Newcastle tanners.

Hog or pig skins are imported from Russia and other continental countries, and many are supplied by Scotland; their use is chiefly in the manufacture of saddles for horses, etc.

Walrus and hippopotamus hides are tanned in considerable numbers for the use of cutlers and other workers in steel goods, "buffing-wheels" being made of them, often an inch thick, which are of great importance in giving the polish to metal and horn goods. Lately, belts for driving machinery have successfully been made from them.

Kangaroo-skins of various species are tanned or tawed in Australia, and form a kind of leather in great favor for gentlemen's dress-boots.

The first process in making *tanned sole leather* is to soak the skins or hides in water for a greater or less time, to wash and soften them; they are then laid in heaps for a short time, and afterwards hung in a heated room, by which means a slight putrefactive decomposition is started, and the hair becomes so loose as to be easily detached. This process of "unhairing" is mostly followed in America; but in Great Britain, milk of lime is used for soaking the hide till the hair loosens. Hides or skins intended for dressing purposes, such as shoe, coach, harness, or book-binding, after the hair is taken off by the lime, have to be submitted to a process called "bating," for the purpose of reducing the thickening or swelling occasioned by the introduction of the lime, and for

cleansing the skin from grease and other impurities. This is effected by working the skins in a decoction of pigeons' or dogs' dung and warm water, and no dressing-leather is ever submitted to bark or sumac without undergoing this process.

If the old method of *tanning* is followed, the hides, after unhairing, are placed in the tan-pits, with layers of oak-bark or other tanning materials between them; and when as many layers of hides and bark are arranged as the pit will hold, water is let in, and the hides remain to be acted upon by the tanning material for months, and even in some cases for years, being only occasionally turned. But this primitive process is now rarely carried out; so much improvement has been effected in the tanner's art since its chemical principles were discovered that much less time suffices; and materials are now used which act so much more quickly than oak-bark alone that, even if the old process is used, it is greatly accelerated. The most useful of these materials are catechu and cutch (of which 9,000 tons are annually imported into Great Britain from India and Singapore), gambier (about 1200 tons from Singapore), divi-divi (3,000 tons from Maracaibo, etc.), valonia (the acorns of the Quercus *Aegylops*, 25,000 tons of which are yearly imported from Turkey), and sumac leaves (16,000 tons, chiefly from Turkey).

The first attempts at improvement in tanning were the method invented by Mr. Spilsbury in 1823, and the improvement on this method by Mr. Drake, of Bedminster, in 1831. The principle consisted in causing the *ooze* or *tan-liquor* to filter through the hides under pressure. For this purpose, in Drake's process, the edges of the hides were sewed up so as to form a bag. The bags being suspended, were filled with cold tan-liquor, which gradually filtered through the pores of the hides, and impregnated them with the tannin. The processes by infiltration, however, have been entirely abandoned for heavy leather, as they have the effect of rendering the leather porous and deficient in firmness.

Various patents for improvements in tanning have been in operation of late years. Herepath & Cox, of Bristol, tied hides to each other to form a long belt, and pressed them between rollers to squeeze out the partially exhausted tan-liquor from the pores, so that a stronger liquor might be absorbed. Messrs. J. & G. Cox, of Gorgie Mills, near Edinburgh, made an improvement on this mode, by attaching the hides to a revolving drum, so that the hides press on each other on the top of the drum, but hang suspended in the tan-liquor from the lower part; and thus, by the hides being alternately in and out of the liquor, the tanning is quickly effected.

After the hides have become thoroughly tanned in the pit by the action of the tannic acid upon their gelatinous substance, and when partly dried (if for "struck" sole-leather), they are operated upon by a two-handled tool with three blunt edges, called a pin, which, by being rubbed with great pressure backwards and forwards on the grain-side of the leather, makes it more and more compact; and this is still further accomplished by submitting the leather to the action of a heavily loaded brass roller.

The tanning of goat-skins (from which our morocco is made), sheep for imitation-morocco, and small calf-skins for book-binding is done by sewing up the skins, and filling the bag with a decoction of sumac in a warm state. They are kept in an active state for twenty-four hours or so, which sufficiently saturates them.

A process has been patented by Mr. Preller, of Bermondsey, within the last few years, by which the heaviest skins are converted into leather in a very short space of time; but the process is tawing rather than tanning, and is used for machinery belts principally.

Tawing consists in dressing the skins with antiseptic materials, so as to preserve them from decay; but by this operation no chemical change is effected in the gelatine of the skins; hence, tawed leather can be used in the manufacture of glue. In tawing, the first process is careful washing, next dressing them with lime, then removing the hair or wool, and lastly, steeping them in some one or more of the various mixtures which are used for converting skins into leather by this method. The method of tawing lamb-skins will give a fair idea of the process, which is, however, much varied, according to the kind of skin and the experience of the worker. Lamb-skins of home-production are generally limed on the flesh-side with cream of lime, which enables the wool to be easily pulled off. Dried lamb-skins are generally submitted to the *heating process*, to get the wool removed. The pelts, after being washed, are rubbed on the convex piece of wood called the *beam*; and when supple, the flesh-side of each skin is thickly besmeared with a cream of lime; and when two are so treated, they are laid with the limed surfaces in contact; and a pile of them being made, they are left for a few days, when they are examined by pulling the hair. If it separates easily, then the lime is washed out, and the hair is removed with the unhairing knife, as in the case of hides, unless it is required to be kept on, as in the case of skins for door-mats, etc. After thorough cleansing, the pelts are steeped for two or three weeks in a pit filled with water and lime, being taken out from time to time, and drained on sloping benches. When removed finally from the lime-pit, the skins are worked with the knife, to render them still more supple, and they are then put into the *branning* mixture. This consists of bran and water, in the proportion of two pounds of bran to a gallon of water. From this mixture, in about two days, they are transferred to another bath, consisting of water, alum, and salt. After the proper amount of working in this mixture, they undergo what is called the *pasting*, if intended to form white leather. The *paste* is a mixture of wheaten-bran and

sometimes flour and the yolks of eggs. They are usually worked in a rotating cylinder with this paste and water, and are found in time to have absorbed the paste, leaving little more than the water. If the skins are not intended to be white, other materials are often used, and much pigeons' and dogs' dung is employed, some large leather-dressers expending as much as £100 per annum upon each of these materials. Lastly, the skins are dried and examined, and, if necessary, the pasting is repeated; if not, they are dipped into pure water and worked or staked by pulling them backwards and forwards on what is called a *stretching* or *softening* iron, and smoothed with a hot smoothing-iron.

Another kind of dressing is by treating the skin with oil. By hard rubbing with cod oil, or by the action of "stocks" after the skin has been properly cleaned with the lime, the oil works into the skin, displaces all the water, and becomes united with the material, rendering its texture peculiarly soft and spongy. Wash-leather or chamois-leather is so prepared, and for this purpose the flesh-halves of split sheep-skins are chiefly used.

Besides *tanning* and *tawing*, many kinds of leather require the currier's art to bring them to the state of completion required for various purposes. The currier receives the newly tanned skins, and finds them harsh to the feel, and rough on the flesh-side. He removes all the roughness by carefully shaving with a peculiar knife. After soaking in clean water, he then scrapes the skin with considerable pressure upon a scraping-tool or *slicker*, and thus removes any irregularities. The moisture is then removed as much as possible, and oil, usually cod oil and tallow, are rubbed over the leather, which is laid aside to dry completely, and as the moisture leaves it, the oil penetrates. When quite dried and saturated with the oil, the skin is rubbed on a board with rounded ridges, by which a peculiar grained appearance is given, and the leather is rendered very pliable. In currying, almost every variety of leather requires some variation in the processes employed, but the currier's object is in all cases to give a suppleness and fine finish to the skins.

Morocco leather, formerly an article of import from the Barbary coast, is now prepared in large quantities in this country from goat-skins; sheep-skins are also used for imitation. It is always dyed on the outer or grain side with some color, and the leather-dresser in finishing gives a peculiar ribbed or a roughly granulated surface to it, by means of engraved boxwood balls which he works over the surface.

Russia leather is much valued for its aromatic odor, which it derives from the peculiar oil of the birch-bark used in tanning it. The fact that this odor repels moths and other insects renders this leather particularly valuable for binding books; a few books in a library, bound in Russia leather, being effective safeguards against insect enemies. It is also said to destroy or prevent the vegetable evil called mildew, to which books are so very liable.

LEATHER (ante). The following are the exports and imports of hides, skins, and leather for the years 1878, 1879, and ten months of 1880, to Oct. 31, for the United States:

EXPORTS.

	1878	1879	10 m. 1880
Leather, sole and upper.....	\$6,213,625	\$5,096,685	\$5,251,822
Morocco and other fine.....	963,581	664,889	656,664

IMPORTS.

Hides and skins.....	\$16,458,698	\$19,982,400	\$26,123,754
Leather.....	3,390,842	5,376,883	5,874,505

LEATHER, VEGETABLE, is a composition the base of which is supposed to be oxidized oil. It is spread over cotton or other cloth, and is used as a water-proof material for carriage-hoods, seats, gaiters, boots, etc. At present, it is only made by one company, which holds the secret of its manufacture.

LEATHER-CLOTH, or **AMERICAN LEATHER-CLOTH**, is a common name for coated or enameled textile fabrics intended to possess some of the good qualities of leather without being so costly. As far back as 1849 a material under this name was invented in America; and many specimens of it were placed in the great exhibition of 1851. In 1855 a factory for making it was established at West Ham, in Essex, and the operations are still continued there on a large scale. Linseed oil is heated in large coppers to a certain high temperature, then removed to cool; then mixed with other ingredients, two of which are turpentine and lampblack. This composition is used as a kind of varnish to be applied to the surface of unbleached cotton. The cotton, woven to various widths and lengths, is calendered to make it smooth, and then passed over a roller; the composition is applied to it, and a peculiar kind of knife scrapes the layer to an equable thickness and a smooth surface. After being dried in a heated oven, the cloth is passed between rollers covered with pumice-dust, to rub the composition smooth. These processes are repeated four or five times. The cloth is next painted three or four times with a kind of enamel paint. Some kinds are grained like morocco leather, by being passed between rollers peculiarly grooved on the surface; others receive a pattern in relief by passing between embossing rollers.

Leather-cloth manufactured by this or some similar process is now largely made in

England. Besides the one at West Ham, there is an extensive factory at Lancaster, and the manufacture has also been tried at Glasgow. The best American made stuff is, however, still preferred by some consumers. Both English and American makes are much used for covering the cheaper articles of furniture, instead of leather or hair-cloth, and for this purpose the better qualities last well. These dearer kinds do not exceed one-eighth of the price of morocco leather, and are also much cheaper than hair-cloth or sheep's-skin. Like floor-cloth, or any other kind of fabric coated with oil-paint, American leather-cloth wears best in apartments not subject to extremes of heat and cold. Several varieties of enameled or painted calico, more or less resembling the original American leather cloth, have at different times been made on a considerable scale, but none have been found so serviceable as the ordinary kind, so that they have speedily gone out of use. There is a cheap kind of enameled cloth, more highly glazed than what is usually made for furniture, much used for covering trunks, making small bags, and the like.

Those kinds of imitation leather which consist essentially of calico or other woven fabric coated with a layer of india-rubber, previously dissolved by some solvent, such as naphtha, and mixed with other materials to give it body, are numerous, and pass under different names; but no real line of distinction can be drawn between them and the almost endless varieties of textile fabrics made waterproof by a thin layer of india-rubber. Few of these retain very long the properties they have when newly made. The vulcanized rubber eventually rots, or at least undergoes some change by which it loses its elasticity, and then it cracks, tears, or peels off.

Leather-cloth made on Seager's patent is in fact leather, not cloth. It consists of leather parings and shavings, reduced to a pulpy mass, and molded to any useful or ornamental forms. Le Jeune's *leather substitute* consists of a cement or mastic of caoutchouc or of gutta-percha on cloth, felt, or leather, pressed by rollers, and then pressed upon a layer of leather. By a peculiar splitting machine, a sheet is produced with an extremely thin layer of leather upon it. Spill's *vegetable leather* is made chiefly of caoutchouc and naphtha, the sheets being thickened to any degree by successive backings of canvas. The material is tough, resists damp, and takes on a polish. Szerelemey's *leather cloth* is made by the application of oily pigments to cloth.

LEATHERWOOD, *Dirca palustris*, a deciduous shrub of 3 to 6 ft. high, with the habit of a miniature tree, a native of North America. It belongs to the natural order *thymelaeaceæ*. The bark and wood are exceedingly tough, and in Canada the bark is used for ropes, baskets, etc. The leaves are lanceolate-oblong; the flowers are yellow, and appear before the leaves.

LEATHES, STANLEY, b. Ellesborough, England, 1830; educated at Cambridge; was curate in several churches in London; professor of Hebrew in 1863 in King's college, London; minister of St. Philip's, London, in 1869; Boyle lecturer, 1868-70, at Whitehall; Hulsean lecturer at Cambridge in 1873; and Bampton lecturer at Oxford in 1874; a delegate to the evangelical alliance in 1873 in New York, and is now a member of the Anglican committee for the revision of the Old Testament. He is the author of a well-known work, *Witness of St. John to Christ*.

LEAVE AND LICENSE, a phrase in English law to denote that leave or permission was given to do some act complained of. It is a common defense in actions of trespass.

LEAVEN, "sour" dough, or dough in which putrefaction has begun, and which, owing to the presence and rapid growth or multiplication of the yeast-plant, quickly communicates its character to fresh dough with which it is mingled, causing the process of fermentation to take place sooner than it otherwise would. The use of leaven in baking dates from a very remote antiquity; the employment of yeast is more recent. See YEAST and BREAD.

LEAVENWORTH, a co. in n.e. Kansas, bounded e. in part by the Missouri, and s. by Kansas river; 450 sq.m.; pop., '80, 32,360; intersected by the Kansas Central, the Kansas Pacific, and the Missouri Pacific railroads; surface undulating and diversified with prairies and timber-tracts; soil very fertile; chief productions, corn, oats, hay, pork, and cattle. Valuation of real and personal estate, \$23,476,311. Capital, Leavenworth.

LEAVENWORTH, a city of Kansas, United States of America, founded in 1854, on the right bank of the Missouri river, 25 m. above Kansas city. It is a handsome town of broad avenues, has 26 churches, numerous schools, 4 banks, daily and weekly papers, and large mills and factories. It is the head-quarters of the government contractors for trains to Utah, New Mexico, etc. Six lines of railway center here, and the river is crossed by an immense iron bridge. Pop. '70, 17,873.

LEAVENWORTH (*ante*), a city of Kansas and the capital of Leavenworth co., situated upon the w. bank of the Missouri river, 38 m. above Kansas City, and 296 m. below Omaha; lat. 39° 19' n., lon. 94° 58' w.; pop. '80, 16,555. It is the e. terminus of the Kansas Central railway, and is on the Leavenworth road, leased as a branch of the Missouri Pacific. The Leavenworth and Northwestern railroad extends hence to Atchison. The Leavenworth branch of the Kansas Pacific connects it with Lawrence, and the Kansas City, St. Joseph, and Council Bluffs railroad is on the opposite bank of the river. The place is also one of the termini of the Chicago, Rock Island, and Pacific railroad, which

here crosses the Missouri on a fine new iron bridge, which cost \$1,000,000. A stratum of fine limestone which crops out here protects the place from the encroachments of the river, and makes good landing-places. The city is regularly laid out, the streets for the most part crossing each other at right angles, and lighted with gas. It has 24 churches, a court-house, a high-school, a state normal school; a Roman Catholic academy, orphanage, and hospital; 2 national and 2 savings banks, 2 theaters, and numerous manufacturing establishments, including breweries, book-binderies, cigar-factories, machine-shops, flouring-mills, saw-mills, foundries, brick-yards, etc. It has 4 daily, 3 weekly, and 4 monthly newspapers.

LEAVENWORTH, ELIAS WARNER, LL.D., b. Canaan, Columbia co., N. Y., 1803; spent his early years at Great Barrington, Mass., and graduated at Yale in 1824. He studied law for a time in the office of William Cullen Bryant, at Great Barrington, afterwards spent two years in the law-school at Litchfield, Conn., and was admitted to the bar in 1827, removing in the same year to Syracuse, N. Y. Here he practiced his profession for many years, until ill-health forced him to retire. He was twice elected mayor of the city, was a member of the state assembly in 1850 and 1857, president of the board of quarantine commissioners in 1860, and regent of the New York university in 1861. In Mar., 1861, he was appointed by president Lincoln commissioner under the convention with New Granada, and in 1865 was president of the board of commissioners appointed to locate the state asylum for the blind. In the same year he was trustee of the state asylum for idiots, and was twice re-appointed to the same post. He was a member of the constitutional commission of 1872. In 1874 he was elected to congress. In 1873 he published the *Genealogy of the Leavenworth Family in the United States*. He has since held other posts of honor and responsibility.

LEAVENWORTH, HENRY, 1788-1834, b. Conn.; entered the profession of law, but enlisted in the army in 1812 as cap. of infantry, was made a maj. in 1813, and commanded his regiment in the battles of Chippewa and Niagara Falls in July, 1814. In the latter engagement he was wounded, and for his gallantry in both he was made lieut.col. and col. by brevet. He was appointed lieut.col. in the regular army in 1818, and afterwards commanded an expedition against the Indians of the upper Missouri river. He was brevetted brig.gen. in 1824, and appointed col. of the 3d infantry in 1825. He was the founder of Fort Leavenworth and other military posts on the western frontier. Died in the Indian territory.

LEAVES, *folia*, are organs of plants, springing from the sides of the stem or branches, generally more or less flat and green, never bearing flowers, and of great use in the vegetable economy, as exposing the sap to air and light on their extensive surfaces. It is usually in the axils (q.v.) of leaves that buds and branches are developed; and with reference to buds and branches, they are never situated otherwise than beneath them, although in the axils of many leaves no development of bud or branch ever takes place. After its full development, a leaf retains its form and size unchanged till its death. As to the duration of their life, leaves exist either for one year—that is, during a year's period of active vegetation—in which case they are called *deciduous* (q.v.), or for more than one year, when they are called *evergreen* (q.v.).

A leaf first appears as a little conical body pushed out from the stem or branch. At first it consists entirely of cellular tissue, continuous with the bark, but vascular tissue afterwards generally appears in it. When fully developed, it usually consists of two parts: an expanded part, called the *blade* or *limb*; and a stalk supporting this part, and called the *leaf-stalk*, or *petiole*, which sometimes assumes the form of a *sheath* of the stem, as in grasses. The leaf-stalk, however, is often wanting, in which case the leaf is called *sessile*; and when the base of the leaf embraces the stem, it is called *amplexicaul*. A leaf which has a leaf-stalk is called *petiolate*. Sessile leaves often extend in wing-like prolongations down the stem, and are then called *decurrent*. They are sometimes *perfoliate*, entirely surrounding the stem with their base, so that it seems to pass through the leaf. Opposite leaves are sometimes combined in this way. Leaves are called *simple* when all their parts are united into one whole by a connected cellular tissue; they are called *compound* when they consist of a number of distinct, completely separated parts, which are called *leaflets*.—As to the place where leaves arise from the stem, they are either *radical* (root-leaves), when they arise from the very base—and many plants have radical leaves only; or *cauline* (stem-leaves), when they arise from the *developed* stem or branches—the radical leaves really arising from the stem; or *floral*, when they arise from the flowering axis.—As to their arrangement on the stem, leaves are *verticillate*, or *whorled*, or *opposite*, or *alternate*, or *scattered*. Opposite leaves are usually placed so that each pair is at right angles to those next above and below. All these modes of arrangement on the stem can be reduced either to the *whorl* or to the *spiral*; whilst by the tearing out of the whorl the spiral arrangement arises, and the whorl by the compression of the spiral, but so that the whorl and the spiral are essentially the same. The number of leaves requisite to form a complete *cycle*, or to encircle the stem, is very constant in the same species. In the common houseleek, the cycle consists of no fewer than 13 leaves, which are grouped together to form the *rosette* of this plant.

Leaves consist either exclusively of cellular tissue, as in mosses, or, more generally, of cells and bundles of spiral vessels, as in the leaves of trees and most other phanerog.

amous plants. The stronger bundles of vessels form *nerves*, externally conspicuous, the finer ramifications of which are called *veins*. In endogenous plants, the nerves of the leaves run mostly in straight lines, and nearly parallel; whereas, in exogenous plants, a net-like ramification of the nerves prevails.

The leaves of phanerogamous plants and ferns are covered with a well-developed separable *epidermis*, which extends over all their parts, and which is provided with numerous small pores—*stomata* (q.v.)—sometimes on one, sometimes on both sides, serving for the absorption and exhalation of gaseous substances. Submerged leaves, however, and the under side of leaves which float on the surface of water, have no stomata, no true epidermis, and no true vascular tissue.

Some plants have no leaves, their functions being performed by the green juicy rind of the stalks, as in *cactaceæ* and some of the genus *euphorbia*; or by the general surface of the thallus (q.v.) in many acrogenous plants.

It is in the leaves of plants that the elaboration of the sap chiefly takes place, and when a tree is deprived of its leaves, no wood is formed until they are again developed. The incessant removal of leaves as they are formed destroys a plant, and this method is sometimes advantageously adopted as to weeds having deep or spreading perennial roots, and otherwise difficult of extirpation.

Leaves exhibit more or less decidedly a periodical alternation in their direction and expansion, generally corresponding with the alternation of day and night. Some leaves exhibit a peculiar irritability under various influences, and those of two or three species of plants, by their closing together, catch and kill insects which alight on them, a thing, however, of which no relation to the vegetable economy is known. See IRRITABILITY IN PLANTS, SLEEP OF PLANTS, and DIONÆA.

The forms of leaves are extremely various. *Simple* leaves vary from a form almost perfectly circular, or even broader than long, to an extreme elongation, as *linear* or *filiform* (thread-like). The breadth of some increases towards the apex, and this is indicated by the terms *obovate*, *obcordate*, etc., and sometimes by the word *inversely* prefixed to the term which describes the form. Simple leaves are either *entire*, or they are more or less deeply *toothed* or *serrate*; or they are *cut* or *lobed* by divisions extending from the margin towards the base; or the division may extend towards the midrib of the leaf, when the leaf is *pinnatifid*, or *sinuate*, or *runcinate*, etc. Terms similar to those employed to describe simple leaves are applied to the leaflets of compound leaves, but the variety of forms is not nearly so great. Compound leaves exhibit two chief varieties of form, according as the divisions which form the leaflets extend towards the base of the blade, or towards the midrib. Of the former class are *ternate*, *quaternate*, *quinate* leaves, etc.; the latter are called *pinnate* leaves. But the same mode of division may be repeated in the leaflets, and thus a leaf may be *binate*, or, if again divided, *trinerviate*, etc., and very many leaves are *bipinnate*, *tripinnate*, etc. When the division is often repeated, the leaf is called *decompound*. A pinnate leaf, terminating in a pair of leaflets, is called *pari-pinnate*, or *abruptly pinnate*; but a pinnate leaf very often terminates in an odd leaflet, and is then called *impari-pinnate*. The blade of a leaf is generally in the same plane with the stalk, but is sometimes at right angles to it, as in *orbicular* and *peltate* leaves.

The *vernation* (q.v.) of leaves, or the manner in which they are folded in bud, is, like the *activation* of flowers, very characteristic of different plants and tribes of plants.

Root-leaves are generally larger than *stem-leaves*, but are only present in herbaceous plants, and are generally the first to fade. The upper stem-leaves are generally smaller and less divided than the lower, those nearest the flowers often passing into bracts. By metamorphosis of leaves, all bracts, involucres, etc., are produced, and all the different parts of flowers, as calyx, corolla, stamens, carpels, and therefore even fruits; and the mode of their arrangement relatively to the axis corresponds with that of leaves. All organs formed by metamorphosis of leaves are called *leaf-organs*. See MORPHOLOGY.

Seed-leaves are the cotyledons of the seed, raised above ground after germination, and serving the purposes of leaves to the young plant, although generally very unlike its future leaves. This, however, only takes place in some plants.

LEAVITT, JOSHUA, D.D., 1794-1873; b. in Heath, Franklin co., Mass.; graduated at Yale in 1814; was admitted to the bar in 1819, and practiced for a time in Heath, Mass., and Putney, Vt.; graduated at the Yale divinity school in 1825, and during the next three years was pastor of the Congregational church in Stratford, Conn.; from 1828 to 1831 was editor of the *Sailors' Magazine*. It was at this time that the churches of most of the Protestant denominations in the United States were much agitated upon the subject of revivals of religion, for the promotion of which many pastors adopted what were then called "new measures," such as the employment of "evangelists," the holding of "protracted meetings," "inquiry meetings," etc. The *New York Evangelist* was established to promote revivals and defend the "new measures," and from 1831 to 1837, Dr. Leavitt was its editor. During this period the anti-slavery agitation had its beginnings, and from the first it enlisted the warm support of Dr. Leavitt, who made the *Evangelist* a powerful but discreet agent for its promotion. When the American anti-slavery society was organized in 1833, he accepted its doctrines of the sinfulness of slaveholding and the duty of immediate emancipation, and became one of its most active and

influential members. From 1837 to 1840 he was the editor of the society's weekly organ, *The Emancipator*, and a member of the executive committee. When the abolitionists divided in 1840, he went with the new organization, and thenceforth his anti-slavery efforts were mainly confined to the political arena. He was an active promoter of the "liberty" and the "free soil" parties. In 1848 he became office editor of *The Independent*, retaining a connection therewith to the day of his death. About 1834 he compiled and published *The Christian Lyre*, a work containing the great body of the hymns and tunes chiefly used in the revivals of that day. It had a very wide circulation. He reported and published many of the sermons of Charles G. Finney. He also spent several winters in Washington, for the purpose of observing and reporting the action of congress upon questions relating to slavery, and while thus engaged was in close confidential relations with John Quincy Adams, Joshua R. Giddings, and other opponents of slavery then in congress, by whom his counsel was highly prized. It is understood that shortly before his death he began to write a semi-biographical and semi-historical account of his labors in the anti-slavery cause, and it is to be deeply regretted that he did not live to complete the work.

LEBANON, a co. in s.e. Pennsylvania, taken in 1816 from the counties of Lancaster and Dauphin. It is well watered by the Swatara river and the Little Swatara, with their branches; 288 sq.m.; pop. in '80, 38,476—37,845 Americans. The Third mountain, a spur of the Blue mountain range, forms its n.w. boundary, and the First and Second mountains, the extreme north-west. The Conewago hills lie in the extreme s., and the valley of the Swatara creek, a tributary of Susquehanna river. It is traversed by the Lebanon Valley, the Lebanon and Tremont, and the Schuylkill and Susquehanna railroads. The Union canal, the first in the American colonies, passes near the Swatara river, and Tulpehocken creek. The streams furnish extensive water-power for planing, saw, and flour mills. It includes Lebanon valley, which is bounded on the n.w. by the single, narrow ridges of the Kittatinny mountains, and on the s.e. by the steep, stony hills of South mountain, having undulating slate and limestone lands, abounding in every element of fertility. Indian-corn, wheat, rye, buck-wheat, flax-seed, and quantities of well-flavored fruit are produced; and cattle, sheep, and swine are raised. Strawberries, grapes, and mulberries grow wild, and maize is an original product. It contains rich mines of iron ore, copper, slate, limestone, and marble. Pig iron is the chief article of export. The principal industries are the manufacture of bar iron and castings, both for exportation and home use, clothing, carriages, saddlery and harness, tin, copper, sheet-iron ware, and cigars. Value of manufactures in 1870, inclusive of pig iron, \$4,160,084. Seat of justice, Lebanon.

LEBANON, a t. in s.w. Illinois; the seat of McKendree college, a Methodist Episcopal institution, organized (as reported) 1828, chartered 1835, having a library of 10,000 volumes; pop. '70, 2,117. It is in the northern portion of St. Clair co., on the Ohio and Mississippi railroad, 22 m. from St. Louis. It is delightfully situated on Silver creek, which flows s.e., emptying into the Kaskaskia river about 23 m. below, and is much frequented in the hot season by residents of neighboring cities. It has a brisk trade, and is engaged in farming and coal mining. It has 2 newspapers, 8 churches, 1 brewery, 1 distillery, a manufactory of agricultural implements, and 4 hotels. The students of McKendree college publish a semi-monthly magazine.

LEBANON, a t. in Kentucky on a branch of the Louisville and Nashville railroad; pop. '70, 1925—\$23 colored. It is the seat of justice of Marion co., and a central point for the transportation of the products of several adjacent counties. It is 5 m. from Rolling fork of Salt river, and 43 m. s.w. of Frankfort, 67 m. s.e. of Louisville, and 58 m. s.w. of Lexington. It has 2 weekly newspapers, 2 national banks, 6 churches, several hotels, and a court-house. It is situated on Hardin's creek, and has one flour-mill. Manufactures of furniture, carriages, sashes and blinds are the principal industries; and there are two distilleries and a tannery. It has excellent public schools. The Lebanon Baptist female college was established there in 1869. The place includes St. Mary's station, the seat of St. Mary's college, a Roman Catholic institution.

LEBANON, a borough in Pennsylvania, on the Union canal, at the junction of the Lebanon Valley and Lebanon and Pine Grove branches of the Philadelphia and Reading railroad. It is the terminus of the Cornwall railroad, which is laid from this point to the Cornwall ore mines, at the distance of 7 m. in a southern direction, comprising three hills of iron ore veined with copper, called, respectively, Grassy, Middle, and Big, with branches of railway to furnaces; pop. '70, 6,727. It is connected with the Schuylkill company coal mines by the Lebanon and Tremont railroad. It is on the Quittapahilla creek, 25 m. from Harrisburg, 28 m. w. of Reading, 26 m. n.e. of Harrisburg, and 86 m. n.w. of Philadelphia. It is a well-built town mostly of brick and stone houses, has good hotels, a library, court-house, and 3 national banks with a capital of \$350,000, 2 savings-banks, a state bank, 7 newspapers, including 2 German and 1 English and German. It has 14 churches, a Roman Catholic institution of learning, and excellent public schools. It is the center of an iron mining district, and 6 m. away there is a quarry of gray marble. Its leading industries are the manufacture of iron implements and castings, engines and boilers, carriages, machinery, and railroad cars. It supplies anthracite

coal for 8 large furnaces, and has manufactories of paper, organs, stoves, hollow ware, and bells.

LEBANON, a t. in Tennessee, on a branch of the Nashville, Chattanooga, and St. Louis railway, 30 m. e. of Nashville, and 6 m. s. of the Cumberland river, on a branch of which it is situated; pop. '70, 2,073—917 colored. It has saw-mills, steam flouring mills, and several manufactories of cotton and woolen goods, and brooms. It has 2 national banks, and 7 churches. It is the seat of justice of Wilson co., and has a market-house, a town-hall, and other public halls. It contains a number of educational institutions, including Cumberland university, organized by Cumberland Presbyterians in 1842, embracing, besides the preparatory school, commercial, collegiate, theological, law, and engineering departments, and a library of 6,000 vols. It has also a business and telegraph college, 2 young ladies' seminaries, and a sufficient number of public schools. It has a quarterly magazine published in the interest of education, and a weekly newspaper.

LEBANON, MOUNT, or JEBEL LIBNAN, the western and higher of two mountain-chains which run through Syria from n. to s. parallel with the coast of the Levant. Its average height is about 7,000 ft., but its loftiest peak, Dahrel-Khotib, in the range called Jebel Makmel, attains an elevation of 10,050 feet. For six months of the year this mountain is covered with snow. The next highest point is Jebel Sunnin, 8,555 feet. The road from Baalbek to Tripoli crosses Lebanon at an elevation of 7,330 feet. From the western side of the range several spurs strike off across the narrow strip of level coast, and project upon the Levant in bold promontories. In the s. are the sources of the Jordan, the most important river that rises in Lebanon; not far from Dahrel-Khotib, those of the Orontes, the next largest stream, which flows northward, and intersects the chain at Antaki (*Antioch*). Lebanon derives its name, not from the snow that whitens its peaks, but from its chalk cliffs. The vegetation of Lebanon is, on the whole, scanty; here and there woods and willow-groves are seen; the lower parts of the mountains, however, are everywhere well watered and cultivated, and the valleys are often covered with orchards, vineyards, olive and mulberry plantations, and cornfields. The habitable districts are mostly in the possession of Maronites (q.v.) and Druses (q.v.). Everywhere the range of Lebanon is wild and solitary; the only sound that falls upon the ear of the traveler is the scream of the eagle. Numerous monasteries offer comfortable accommodation to the weary traveler at the close of almost every day's wanderings. The once famous cedars of Lebanon have almost disappeared; only a solitary grove remains. See CEDAR of LEBANON.

ANTI-LEBANON, or *Jebel-es-Sherki*, lies e. of the preceding; the range is less compact, and its average height inferior. The great plain between the two is known as Coele-Syria (q.v.). Anti-Lebanon terminates southwards in Mt. Hermon, its highest point, which reaches an elevation of 8,376 feet. Its sides are clothed with green poplar-trees, but it has no cedars. On its table-lands are found numerous little lochs or tarns, which are a characteristic feature of this range, and distinguish it from Mt. Lebanon.

LEBANON SPRINGS, a village of Columbia co., N. Y., a favorite summer resort, famous for possessing the only thermal spring in New York and New England, having a temperature of 73°, and discharging 500 gallons per minute. The village is situated 1000 feet above the level of the sea, and is within viewing distance of the Hudson river and Catskill mountains. It is frequented chiefly for recreation, though its waters have a reputation as a remedy for rheumatism, liver-complaint, and cutaneous affections. The surrounding country offers the charms of beautiful and varied scenery, and the drives are numerous and attractive.

LEBAS, JEAN-BAPTISTE-APOLLINAIRE, 1797-1873; a French engineer principally distinguished for having been employed by the French government in 1836 to take down, transport, and erect the Egyptian obelisk presented to France by the viceroy of Egypt. To his skill in inventing or improving machinery required for that colossal work is due the entire success of the removal. The government published an elaborate work, edited and illustrated by Lebas, on the history and appliances of this achievement.

LE BAS, PHILIPPE, 1794-1861; son of Philippe François Joseph, associate of Robespierre and St. Just; an antiquarian and philologist. From 1820 to 1827 he had charge of the education of Louis Napoleon, afterwards emperor. He filled various literary positions from 1829 to 1846, and was considered one of the most erudite of Frenchmen. Notwithstanding his early connection with the education of Napoleon III., he denounced the *coup d'état*; was a brave supporter of republican opinion; and always defended with warmth the revolutionary vigor of his father's acts. His works are numerous, and of grave and solid character.

LEBEDIAN', a district t. of Great Russia, in the government of Tambov, 100 m. w.n.w. of the city of that name, on the Don, in lat. 53° north. It has two annual fairs, the commercial transactions of which realize £700,000. One of the chief articles of sale is horses; and government officers frequent the fairs of Lebedian in order to furnish horses for the cavalry regiments. Pop. '67, 5,665.

LEBEDIN', a t. of Little Russia, in the government of Kharkov, 90 m. n.w. of the town of that name, in lat. $50^{\circ} 35' n.$, long. $34^{\circ} 30' e.$ It was founded in the 17th century. Pop. '67, 15,149, who manufacture girdles and sashes to the value of many thousand rubles. These articles, which are worn by the Russian peasants, are sent for sale to Moscow, and to the fairs of Nijni-Novgorod, Kursk, etc.

LEBLANC, URBAIN, b. 1796; a French veterinary surgeon, who largely advanced veterinary art by the invention of means to practice surgery on animals, especially horses, and by treatises on their diseases, and the treatment of them.

LEBŒUF, EDMOND, b. at Paris in 1809; educated in the polytechnic school of Paris; a graduate of the artillery school of Metz, and soon after capt. in the army of Africa. In 1854 he was chief of artillery in the Crimea, was made gen. of brigade, and was then charged with the French part of the siege works at Sebastopol. In 1856 he was attached to the Russian embassy; in 1858 made gen. of division; in 1859 commander-in-chief of artillery. At this time he made the experiments with rifled cannon which contributed to the victory of Solferino. In 1864 he was president of the artillery commission. In 1866 he was sent commissioner to Venice to receive from Austria the cession of Venetia to Italy; in 1868 commander of the camp at Chalons; and in 1869 head of the 6th army corps at Toulouse. In Aug. of the same year he became minister of war; resigned with his colleagues Dec. 27; in Jan., 1870, was made marshal of France. In April of that year he was called before a committee of the French legislative assembly to state the condition of the French army, when he said: "We are ready: so ready that the war may last two years without our having need to buy so much as a gaiter button." When the war with Prussia opened in July, Lebœuf was made maj.gen. of the army of the Rhine. The reverses of the French army at the beginning of the war caused a reaction of public opinion against him, and he was charged with incapacity, deprived of his command as maj.gen., and placed under gen. Bazaine. On Aug. 14 he was put in command of the 3d.corps, plunged it into sanguinary battles with more desperation than skill, and was, with his corps, a part of the force obliged to surrender after the capitulation of Bazaine. Summoned, in 1871, before the committee to investigate the conduct of the war, he reiterated his belief in the proper condition of the army in the beginning, and gave the most damaging testimony as to the conduct of Bazaine.

LE BRETON FLATS, a suburb of the city of Ottawa, situated on Chaudière and Victoria islands, in the Ottawa river. It is unrivaled for water-power, and contains a foundry, several flour mills, saw and planing-mills, a carding and fulling mill, etc.

LEBRIJA (anc. *Nebrissa-Veneria*), a t. of Spain, in the province of Seville, 34 m. s. by w. from Seville, on an affluent of the Guadalquivir, and on the railway between Seville and Cadiz. It is pleasantly situated on a slight eminence, which overlooks a plain liable to be overflowed by the Guadalquivir and its branches. A large church, originally a mosque, exhibits a strange combination of the Arabic, Roman, and Gothic styles. Lebrija is famous for its oil. There are manufactures of woolen cloth, hempen fabrics, glass, pottery, bricks, tiles, and soap. Pop. 12,000.

LEBRUN, CHARLES, a French painter, b. at Paris, Mar. 22, 1619; studied in the school of Vouet, and afterwards at Rome, under Poussin, for six years, returning to France in 1648. He became principal court-painter to Louis XIV., and died at Paris, Feb. 12, 1690. Lebrun's best works are a series of pictures representing the battles of Alexander, which were felicitously engraved by Gérard Audran. Lebrun belongs to the classical and artificial school, but he is a very favorable specimen of it.

LEBRUN, or LE BRUN, CHARLES FRANÇOIS, Duc de Piacenza (Plaisance), 1739-1824: b. France; joint consul with Napoleon, and, under the first empire, minister of finance and confidential envoy. He began public life as secretary of Maupœu, president of parliament, was made inspector of crown lands, and by his influence was practically, though not nominally, the head of the cabinet of Louis XV. On the dismissal of the Maupœu ministry Lebrun was in retirement till 1789. At the dawn of the revolution he wrote a pamphlet of rare wisdom, entitled *Voice of the Citizen*, and was sent to the first council of the states-general. Not being an orator, he bore an inconspicuous part in that remarkable body. He was made governor of the department of the Seine and Oise in 1791, and distinguished himself by an orderly and vigorous administration. Twice arrested and imprisoned under the Robespierrean dynasty, he was freed by the Tallien revolution in 1795, and elected deputy to the council of the ancients. In 1799 he was re-elected, acquired a commanding influence in that body, and controlled its financial legislation. After the *coup d'état*, Nov. 12, 1799, by which Napoleon became first consul, Lebrun accepted the position of third consul. Under the empire he was made arch-treasurer and duc de Plaisance. In 1805 he negotiated the union of the Genoese republic with the French empire; on the abolition of the *tribunat* by the emperor he retired to private life; but was called back in 1810, at the age of 71, to govern Holland after the abdication of Louis Bonaparte. There he was retained till the first abdication of the emperor in 1814. On the advent of the Bourbons, his name was struck from the list of peers, but restored in 1819. His French biographers regard him as a remarkable example of a long life of public service unstained by servility, ambition, or

intrigue. Manly in the expression of his opinions, he yielded loyal support to laws and institutions once established, while outspoken in declaring their errors.

LEBRUN, MARIE-LOUISE ELIZABETH VIGÉE, 1755-1842; b. Paris, wife of gen. Lebrun, second duke of Plaisance; remarkable as a portrait painter, and a charming woman. Her father was a painter of talent. Marié took up the art as a child, and studied with J. Vernet. At the age of 20 she was famous. Her portraits of "Comte Orloff," "Souvaloff," the "Comtesse de Brioune," and the "Duchesse d'Orléans" gave her a high place. In 1775 she married Lebrun. It was an unfortunate marriage. Her husband, she afterwards writes, was quite amiable, but terribly addicted to women of low manners and to gambling; so that he wasted not only his own fortune, but her earnings. She lived apart from him, and by her genius and her beauty and refinement of manners, gathered a little court, comprising the highest rank and talent of France, though her apartments were so modest that there were not half chairs enough for her cherished guests. She made more than 20 portraits of "Marie-Antoinette," and was the court artist of her day. She was admitted, after considerable opposition, to *l'Académie* in 1783.

Though in the receipt of large sums of money for her work, her husband seems to have had the talent to coax it away from her for "commercial investments," which brought no returns. At the breaking out of the revolution in 1789 she went to Italy, visited Rome, Naples, Vienna, Berlin, and St. Petersburg, where her fame gave her distinguished receptions. She returned to France in 1802, and soon after visited England; here she made a portrait of "Lord Byron." Napoleon requested her to paint his sister Caroline, wife of Murat, but words let slip by the artist about true and false princesses turned Napoleon against her. She then made a journey to Switzerland, where she made a portrait of "Madame de Staél." On the restoration of Louis XVIII. she was again the painter of the court. Her husband, by whom she had only a daughter, died in 1813, and her daughter, wife of the secretary of the Russian count, Czernitcheff, died in 1818. This remarkable woman, who retained to the last the full possession of her artistic and intellectual faculties, has left most interesting memoirs of her life, under the title of *Souvenirs*, 3 vols. 8vo, Paris, 1835.

LEC'CE, a province in s.e. Italy; 3,293 sq.m.; pop. '72, 493,594. It is in the division of Apulia, and was formerly called Terra d'Otranto. In more ancient times it was itself the division of Calabria, or Messapia. The Apennines cross its entire surface, diagonally, from n.w. to s.e., and it is watered by the Lieto and the Galeso rivers. It has a mild climate, and produces freely corn, cotton, tobacco, wine, and olives; but suffers frequently from excessive drought.

LEC'CE, the chief t. of a province of the same name in southern Italy, 10 m. from the Adriatic, and 25 s.s.e. of Brindisi, had a pop., in 1871, of 21,083. It is the Lupice of the ancient Salentines, the name having become Lycia in the middle ages, and hence Lecce. It contains fine churches and public edifices, the architecture of which is much enhanced by the beauty of the fine white stone found in abundance in the neighborhood, which admits of exquisitely minute cutting. Lecce has a large trade in olive-oil. Pop. of province '71, 493,594; area, 3,293 sq. miles. See OTRANTO, TERRA DI.

LEC'CO, a t. of Austrian Italy, province of Como, at the point where the Adda emerges from the Lago di Lecco, a branch of the Lago di Como, 17 m. n.e. of Como; pop. 7,040. It was an important town under the Romans, and is very prosperous. The people are engaged chiefly in the manufacture of iron and copper ware, silk, cotton and woolen stuffs, in which a considerable trade is carried on. A railway extends hence to Milan.

LECH, a river of s. Germany, Tyrol, and Bavaria. It rises in the Vorarlberg, and after flowing n. 140 m. joins the Danube 26 m. n. of Augsburg.

LECHFORD, THOMAS, d. about 1645; a London lawyer, who emigrated to Boston in 1638, and was the first to practice the profession in New England. He became dissatisfied with the state of things in the colony, and returned in 1641 to England, where he published *Plaine Dealing, or News from New England's Present Government*, etc., and later, *New England's Advice to Old England*. His *Plaine Dealing* was reprinted, with an introduction and notes, in 1867 by J. Hammond Trumbull. Though conceived in a spirit hostile to New England, it is of considerable historic value.

LECKY, WILLIAM EDWARD HARTPOLE, b. Ireland, 1838; was educated at Trinity college, Dublin, and published his first work, *The Leaders of Public Opinion in Ireland*, anonymously, in 1861. His studies now became directed towards philosophical subjects, and in 1865 the first results of these were made public through the issue of his *History of the Rise and Influence of the Spirit of Rationalism in Europe*, a work which made a marked impression on the literary world, mainly on account of the evidence which it afforded of extraordinary erudition and profound contemplation. This impression was sustained by his subsequent work, *History of European Morals from Augustus to Charlemagne* (1869), though in a less degree, on account of the nature and scope of its subject. Nearly ten years were now employed by Mr. Lecky in studies and investigations preparatory to the publication of his *History of England in the Eighteenth Century*, of which vols. i. and ii. appeared in 1878. The first three of these books were translated into

German by Dr. H. Jolowicz, and the *History of Morals* is used as a text-book in German universities. The *Edinburgh Review* concluded a critical examination of the *History of Rationalism*, "with the conviction that Mr. Lecky is one of the most accomplished writers and one of the most ingenious thinkers of the time." The *London Quarterly*, *British Quarterly*, and *Fraser's* have also thoughtfully reviewed his writings.

LE CLEAR, THOMAS, b. Oswego, N. Y., 1818. He was distinguished, at a time when artistic work was rare in this country, for the early exhibition of a talent for portraiture. Against the most unfavoring circumstances he subsequently achieved great success and a prominent place among American painters. In 1832, while still with his father in London, Canada, he painted portraits, and was engaged in panel-painting on the great steamers of the lakes, which at that time were decorated by the best talent procurable. He afterwards made studies of Indians at Green bay, Wis., and portraits at Elmira and Rochester, N. Y. In 1839 he established himself on Broadway, N. Y., and secured complimentary recognition of his picture, "The Reprimand," in its purchase by the art union. From 1844 to 1860 he worked in Buffalo; then returned to New York, where he has done notable works, among which are portraits of Daniel S. Dickinson, Millard Fillmore, the artists Gifford, McEntee, and Hubbard, and Edwin Booth as *Hamlet*, besides several imaginative subjects, such as the "Marble-Players;" "Young America;" and the "Itinerants."

LE CLERC, JEAN, d. 1525; b. France. His enthusiasm for religious reform impelled him to tear from the doors of the cathedral of Meaux the placard of the pope's bull of indulgences, and to replace it with a placard calling the pope the antichrist, etc. He was arrested, tried in Paris, condemned to be whipped with thongs for four days, branded upon the forehead, and banished. Returned to Metz he seemed not cured of his opinion by the vigorous medicine of the court at Paris, and returned to the charge by breaking the Catholic images carried in a procession. He escaped, but afterwards proudly acknowledged the act; was condemned to the stake; and was punished before being burned by the cutting off of his right hand, then his nose, then otherwise maimed, and his neck encircled with three rings of red-hot iron; all of which proceedings failed to convert him from his errors, and he died singing and shouting praises to God.

LECLERC, SEBASTIEN, 1637-1714; b. Metz, France; son of a jeweler. He commenced engraving when 12 years old, and at 23 had mastered all studies to fit him to be a civil engineer. Visiting Lebrun, painter, in Paris in 1655, he was induced to devote himself to engraving in that city. He afterwards executed a large number of engravings that made him famous. Louis XIV. gave him apartments at Gobelins and made him his cabinet engraver; and the French academy made him professor of perspective. His works are remarkable for the boldness of their execution and the perfection of their finish.

LECLERC, VICTOR EMMANUEL, 1772-1802; b. France; was a volunteer in the cavalry service during the revolution; made capt. at the siege of Toulon, where he attracted the attention of young Bonaparte, and was made bearer to Paris of the news of the taking of Toulon. One of the famous army of Italy in Bonaparte's first campaign, he was made gen. of brigade after the battle of St. George, and soon afterward married the famous Pauline Bonaparte. After the return of Bonaparte from Egypt, Leclerc assisted him in Paris to suppress the legislative government, and to assume the title of first consul. Afterwards he commanded a division of the army of the Rhine. In 1801 he was sent to subdue Portugal. The same year he was made capt. gen. of St. Domingo, and required to re-establish slavery there. With a large fleet and 30,000 French troops he met the negro forces under Toussaint L'Ouverture, and after being defeated in a pitched battle, got possession of the great negro leader by treachery, and sent him in chains to France. Leclerc died of yellow fever, and his remains were taken back to France. His career is one which derives its sole interest from connection with the first Napoleon's successes and crimes, with which he was thoroughly identified, and a favorite with the tyrant because a willing tool of his ambition.

LECOQ, CHARLES, b. France, 1830; a composer of light and brilliant music. In 1852 he won the second prize of the *Conservatoire*, and in 1857 became widely known as a composer. The following are among his compositions: *Ondines au Champagno*; *Mysotis*; *Cabaret de Ramponneau*; *l'Amour et son Curquois*; *Fleur de Thé*; *Jumeau de Bergaume*; and *Fille de Madame Angot*.

LECOMPTON, once the capital of Kansas, United States of America, is situated on Kansas river, 60 m. from its mouth at Kansas City. It has greatly declined in population and importance. In 1870 the pop. was only 971.

LECOMPTON CONSTITUTION, a frame of government for the state of Kansas, adopted by an illegally constituted convention held at Lecompton in 1857, and sought to be imposed by illegal and violent measures upon the people of that state. The members of the legislature which called the convention were chosen not by the voters of Kansas, but mainly by intruders from the state of Missouri, who went thither on election day, and, being countenanced by the agents of the national government, took possession of the polls and elected men known to be in favor of the establishment of slavery in

the territory. A very large majority of the voters of the territory were known to be opposed to slavery, and if the national government had protected them from the incursion of hordes of men from Missouri, or even if its officers had not actually encouraged the intruders in their unlawful work, there would have been no difficulty in organizing Kansas as a free state. The Lecompton constitution, framed by a body of men having no more legal authority than a mob, declared the right of slaveholders in Kansas to their slaves to be inviolable, prohibited the legislature from passing any act of emancipation, and forbade any amendment of the instrument before 1864. The scheme for submitting this constitution to the people of Kansas, though denounced as a fraud by Robert J. Walker, the governor shortly before appointed, was approved by president Buchanan. The constitution itself was not submitted even in form to the people; they were only to be allowed to vote upon the question whether they would have the "constitution with slavery" or the "constitution with no slavery," the instrument being so worded that in either case it would virtually fasten slavery upon the rising state. The constitution was thus formally submitted to the electors Dec. 21, 1857. For its adoption "with slavery" the vote returned was 6,226, more than half of which was from the counties along the Missouri border, whose whole number of voters by the census did not exceed 1000. For the constitution "with no slavery" 569 votes were returned, but the great body of the free-state men declined to vote at all, regarding the election as a fraud and a farce. The legally constituted territorial legislature submitted the same instrument to the consideration of the people of Kansas, Jan. 4, 1858, and the result was a majority of 10,226 votes against it. The question was carried to congress, which body ordered still another election to be held Aug. 3, in which the fraudulent constitution was again rejected by 10,000 majority. This virtually ended the struggle for the establishment of slavery in Kansas. An anti-slavery constitution was framed and adopted with all the necessary legal formalities in 1859, and the state was admitted to the union Jan. 29, 1861.

LE CONTE, JOHN, son of Lewis, b. in Georgia, 1818, and was prepared for college by A. H. Stephens; graduated at Franklin college, Athens, now university of Georgia, in 1838. Graduated in medicine in 1841 at the college of physicians and surgeons, New York city, and commenced the practice of medicine at Savannah, Ga., in 1842. In 1846 became professor of natural philosophy and chemistry in Franklin college, and resigned in 1855 to become lecturer on chemistry in the college of physicians and surgeons, New York. Became professor of natural and mechanical philosophy in South Carolina college, at Columbia in that state. In 1869 was appointed professor of physics and industrial mechanics in the university of California, at Oakland, and in 1875 became president of the institution. He is a member of the principal scientific associations, and has contributed many important papers on scientific subjects.

LE CONTE, JOHN EATON, brother to Lewis, an American engineer and naturalist; b. N. J., 1784; d. at Philadelphia, 1860. Entered U. S. army in 1813 as engineer, and made many surveys and plans for fortifications till 1831, when he was retired with rank of maj. Paid much attention to botany and zoology. Published *Monographs of N. American Species of Utricularia, Gratiola, and Ruellia; Observations of the N. American Species of Viola, and Descriptions of the Species of N. American Tortoises*, in the *Annals of the N. Y. Lyceum of Nat. History; A Monography of N. American Histeroides*, in the *Boston Journal of Natural History*, and *Descriptions of Three New Species of Arvicola, with Remarks upon other N. American Rodents*, in the proceedings of the academy of natural sciences of Philadelphia.

LE CONTE, JOHN LAWRENCE, an American naturalist, son of maj. John E.; b. in N. Y., 1825; graduated at college of physicians and surgeons, 1846. Made scientific excursions in western states when a student, and afterwards traveled extensively in North and Central America, transmitting the results of his observations to scientific societies, principally upon the coleoptera of North America, upon which subject he is eminent authority. He entered the army as surgeon of volunteers in 1862, and was promoted to medical inspector in the regular army, retaining the position till the end of the war. In 1873 he was elected president of the American association for the advancement of science.

LE CONTE, JOSEPH, son of Lewis; b. in Georgia in 1823; was prepared for college by A. H. Stephens; graduated at Franklin college, Ga., in 1841; M.D. New York college of physicians and surgeons in 1845. Commenced practice of medicine at Macon, Ga., in 1848. In 1850 went to Cambridge, Mass., to study natural sciences under Agassiz, and accompanied that savant on an exploring expedition to Florida in 1851. After graduating at Lawrence scientific school he became professor of natural sciences in Oglethorpe university. He was made professor of natural history in Franklin college, and was professor of chemistry and geology in the university of South Carolina from 1856 to 1869. Since 1869 he has occupied the chair of geology and natural history in the university of California. Among his papers are: *On the Agency of the Gulf Stream in the Formation of the Peninsula and Keys of Florida; On the Correlation of Vital Force with Physical and Chemical Forces; On Some of the Ancient Glaciers of the Sierras; On the Structure and Age of the Cascade Mountains; and On the Relations of Religion to Science*.

LE CONTÉ, LEWIS; b. in N. J. in 1782; d. in Georgia, 1838, from septic poison. He was of Huguenot descent, ancestors coming to New Rochelle, N. Y.; graduated at Columbia college, N. Y., in 1799; studied medicine with the celebrated Dr. David Hosack; settled in Georgia, taking care of his father's estate and establishing a botanical garden, where he cultivated rare bulbous plants obtained from the cape of Good Hope. He devoted considerable time to mathematics and zoology, as well as botany.

LECOUVREUR, ADRIENNE, 1690-1730; b. Champagne, France; one of the most gifted and versatile of all the women who have made the French stage alike celebrated for the exquisite truth of nature in its impersonations, and the life of love and passion, romance and tragedy, of which its votaries became the exemplars. She was daughter of a hatter, who went to Paris to better his trade. Located near the theater of the *Comédie-Française*, Adrienne, then a grown girl, a laundress, found her genius throbbing for expression in the drama. She organized a little private theater among the neighbors, which was so successful as to draw from the comedians of the Royal theater a complaint against it as an unauthorized theater. The amateur performances thus closed, Adrienne was taken by a kind prior to the actor Legrand, who was struck with her talent and beauty, and gave her lessons in elocution. She secured an engagement in Strasburg, and after some years of provincial successes was called at the age of 27 to enter the *Comédie-Française*. She at once assumed the first place among French actors. Her force of character and high spirit, her noble beauty—intellectual, passionate, but not gross—gave all her personations the stamp of her individuality. She became the lion of Paris, and for 13 years her real life, like her acting, was a stormy elysium, filled with the loves and gallantries of the most eminent men of her time. Voltaire ranked himself among her lovers by some of the tenderest lines *in memoriam* that ever came from his pen. She was poisoned in Paris by some mysterious means employed by a rival of noble family and ignoble character, Françoise de Lorraine, duchesse de Bouillon.

LE CREUZOT. See **CREUZOT, LE, ante.**

LECTERN, or LETTERN (Lat. *lectorium* or *lectricium*), a reading-desk or stand, properly movable, from which the Scripture *lessons* (*lectiones*), which form portion of the various church-services, are chanted or read. The lectern is of very ancient use, of various forms, and of different materials. It is found both in Roman Catholic churches and in the cathedrals and college-chapels of the church of England. The most ancient lecterns are of wood, a beautiful example of which is that of Ramsey church, Huntingdonshire (about 1450); but they were frequently also made of brass, and sometimes in the form of an eagle (the symbol of St. John the evangelist), the outspread wings of which form the frame supporting the volume.—In some parts of the e. of Scotland the precentor's desk in the Presbyterian churches is called the *letran*.

LECTIONARY (Lat. *lectionarium*). one of the service-books of the mediæval church, so called because it contained the lessons (*lectiones*) of the church-service. Of these there are two which deserve special notice. The first is the so-called "Roman lectionary," which contained the epistles and gospels of the Roman missal, and sometimes all the lessons of all the various services in use in the Roman church, in which case it was named the *plenarium*. The most ancient form of the Roman lectionary was called "comes" or "liber comitis." Its compilation was attributed to St. Jerome, and it appears certain that it belongs in substance, although not in form or in details, to that age. The collection was revised and remodeled in the 8th century. The second of the ancient lectionaries is that known as the Gallican lectionary, which was published by Mabillon from a MS. of the monastery of Luxeuil, and which is believed to represent the rite of the ancient Gallican church, chiefly because one of the few saints' offices which it contains is that of the peculiarly French saint, Geneviève. It is interesting as showing that the Gallican liturgy had three lessons, and not two, as in the Roman missal. Unfortunately, Mabillon's MS. of this highly interesting relic of ancient Gaulish Christianity is imperfect, and no other has since been discovered.

LECTISTURNIUM, a sacrificial ceremony observed by the Greeks and Romans on occasions of extraordinary solemnity, when the statues of the gods were placed in a reclining posture on couches, and a feast was spread on tables before them. The ceremony, according to Livy, was first observed in the year of Rome 354, on account of a destructive murrain among cattle. At first a distinction was made between the gods and goddesses, as at the *Epulum Jovis* held in the capitol, where the statue of Jupiter was laid in a reclining attitude, while those of Minerva and Juno were set on chairs. Afterwards this distinction seems to have been neglected, as may be inferred from a representation on the carved handle of a Roman lamp engraved by Bartoli.

LECTOURE, a t. of France, in the second arrondissement of the department of Gers, on the river Gers, 20 m. n. of Auch; pop. 2,963. It is on the summit of a steep, isolated rock, and contains a college, a hospital on the site of the old castle, a handsome Gothic church built by the English, a town-hall, an old episcopal palace purchased by marshal Lannes, a native of the town, and presented by his widow to the corporation, now used for the residence of the mayor and for the courts of justice. In front of this is a statue of the marshal in white marble. Lectoure is surrounded by several fine

promenades. It is an ancient place. It manufactures coarse woolen cloths, and has an active trade in cattle, grain, wine, and brandy.

LECTURES—LECTURESHIPS. In the time of Charles I. the people were accustomed to send to the pulpit requests for prayers in behalf of their friends in the army of Essex. These became so numerous that there was not time to attend to them. Several London ministers therefore agreed to set apart a morning hour for this purpose, devoting the time to prayer and exhortation. After the war it became a casuistical lecture, and was continued till the restoration of Charles II. These sermons were afterwards published in several volumes quarto under the title of the *Morning Exercises*. Archbishop Tillotson and other eminent preachers were the authors. For a month these lectures were given every morning. Most of them were delivered at Cripplegate church, some at St. Giles's, and a volume against popery in Southwark. The time for the lecture has been exchanged for the evening.—The merchants' lectures is the title of a lectureship instituted in London in Pinuer's hall in 1672 by the Presbyterians and Independents, or Congregationalists, to show their essential agreement among themselves, and to support the doctrines of the reformation against popery, Socinianism, and infidelity. The most learned and popular ministers were chosen as lecturers, as Dr. Bates, Dr. Manton, Dr. Owen, Mr. Baxter, Messrs. Collins, Jenkins, Mead, Alsop, Howe, Cole, and others. This lectureship was sustained by some of the principal merchants and tradesmen of the city. Owing to a misunderstanding, the Presbyterians removed to Salter's hall, the Independents remaining at Pinner's hall, and each body decided to select the lecturers from its own denomination. The monthly lectures are delivered monthly by the Congregational ministers of London in their chapels in rotation. They form a connected course of one or more years. In 1827 a volume of these lectures on the evidences of revelation was published.—The Congregational lectures are a series of annual lectures delivered in London by Congregational ministers of Great Britain on theological subjects.—The Dudleian lectures, founded by Paul Dudley, a lawyer, 1675–1751, at Harvard college, for the defense of Christianity, were delivered until very recent years.—The Lyman Beecher lectureship on preaching, at Yale college, was founded by Henry W. Sage of Brooklyn. The first course was delivered by the rev. Henry Ward Beecher in 1872, who was followed by John Hall, D.D., Phillips Brooks, D.D., bishop Matthew Simpson, and Howard Crosby, D.D.—The Ely lectures at Union theological seminary, New York, were founded by Zebulon Ely. The first course was delivered by the rev. Albert Barnes, followed by president McCosh, prof. Andrew P. Peabody, principal Dawson of Canada, and R. S. Storrs, D.D.—The Bohlen lectures were established in Philadelphia in 1878 at the church of the Holy Trinity. Lectures have been given by bishop Huntington, Phillips Brooks, D.D., and dean Howson.—Hibbert lectures, established in London in 1878 for the presentation of subjects pertaining to advanced thought. In this course lectures have been delivered by Max Muller, Ernest Renan, and L. Page Renouf.—The Stone lectures, established by Levi P. Stone, is a series of lectures in Princeton theological seminary. Lectures have been given by William M. Taylor, D.D., R. S. Storrs, D.D., and prof. Flint of Scotland.—See BAMPTON, BOYLE, and HULSEAN LECTURES, *ante*.

LECYTHIDACEÆ, a natural order of exogenous plants, or suborder of *myrtaceæ*, the distinguishing characteristic being that the fruit is a large woody capsule, with a number of cells, which in some species remains closed, and in some opens with a lid. All the known species, about 40, are natives of the hottest parts of South America. All are large trees. They have alternate leaves, and large showy flowers, solitary, or in racemes. The stamens are numerous, and a portion of them sometimes connected into a kind of petal-like hood. Brazil nuts (q.v.) and sapucaia nuts (q.v) are the seeds of trees of this order. The cannon-ball tree (q.v.) belongs to it. The capsules of some species are known as monkey-pots. Monkeys are very fond of the seeds.

LE'DA, in Grecian mythology, the wife of the Spartan king Tyndarens, whom Jupiter visited one night in the disguise of a swan. She became by the god the mother of Castor and Pollux, and after her death was raised to a divinity under the name of Nemesis. The story has supplied a theme for many works of art.

LED'BURY, a small t. of England, in the county of Hereford, is situated 14 m. e.s.e. of the city of that name, on the Hereford and Gloucester canal. Glove-making is the principal branch of industry. Pop. in 1871, 2,967.

LEDERER, JOHN; time and place of birth unknown, but is supposed to have been a German; an early explorer of the mountain regions of Virginia. He wrote in Latin an account of his travels, translated and published in 1672 by sir William Talbot, Bart., under the title of *Discoveries of John Lederer in three several Marches from Virginia to the West of Carolina and other parts of the Continent, begun in Mar., 1669, and ended in Sept., 1670*. He was driven out of Virginia by ill-treatment from the populace, and baron Talbot induced him to write this book for his own vindication.

LEDGER-LINES. See LEGER-LINES, *ante*.

LEDOCHOW'SKI, MIECISLAS HALKA, Count de, cardinal, b. 1822 at Ledochow, Galicia; studied theology at Warsaw, Vienna, and Rome; was domestic prelate and protonotary apostolic to Pius IX. Entering the papal diplomatic service, he was auditor of the nunciature successively at Madrid, Lisbon, Rio de Janeiro, and Santiago de

Chili, nuncio at Brussels, and archbishop of Thebes in 1861. By request of the king of Prussia he was appointed archbishop of Gnesen and Posen in 1866, becoming thereby primate *ex officio* of Poland. In 1873 he took the lead in protesting against the new Prussian ecclesiastical laws, by which the people of the dioceses and parishes were allowed to choose their own bishops and priests. He refused to appear before the courts to justify his action, in consequence of which his property was taken in payment of fines, and he was imprisoned at Ostrowa. He was appointed cardinal Mar. 15, 1875.

LEDRU-ROLLIN, ALEXANDRE AUGUSTE, a noted French democrat, b. in Paris, 1808; studied for the bar, to which he was admitted in 1830. He was counsel for the defense in most of the prosecutions of opposition journals during the reign of Louis Philippe, and obtained a great reputation among the lower orders. In 1841 he was elected deputy by the department of Sarthe, and became a prominent member of the extreme left. In 1846 he published an *Appel aux Travailleurs*, in which he declared "universal suffrage" to be the only panacea for the miseries of the working-classes. He was also an ardent promoter of the reform-meetings that preceded the crash of 1848. On the outbreak of the revolution, he advocated the formation of a provisional government, and when this was carried out was intrusted with the portfolio of the interior. He was afterwards one of the five in whose hands the national assembly placed the interim government. In this high position he showed great want of perception, firmness, and energy. In consequence of the insurrection of June, 1848, he ceased to hold office, and then sought to recover (what he had lost by accepting office) his influence with the extreme democrats. He partially succeeded, and even ventured on a candidature for the presidency, but obtained only 370,119 votes. The unsuccessful *émeute* of June, 1849, put an end to Ledru-Rollin's political rôle. He fled to England, and in less than a year politely published a work against the land which had given him an asylum, *De la Décadence de l'Angleterre*. For the next 20 years he lived alternately in London and Brussels. His name was excepted from the amnesties of 1860 and 1869; but in 1870, a decree having been published permitting him, he returned to France. In Feb., 1871, he was returned to the national assembly, but at once resigned. He died in 1874.

LE DUM, a genus of plants, of the natural order *ericae*, sub-order *rhodoreae*, consisting of small evergreen shrubs, with comparatively large flowers, of which the corolla is cut into 5 deep petal-like segments. The species are natives of Europe and North America; some of them are common to both. The leaves of *L. latifolium* are said to be used in Labrador as a substitute for tea, whence it is sometimes called LABRADOR TEA. Sir John Franklin and his party, in the arctic expedition of 1819-22, used in the same way the *ledum palustre*, which produced a beverage with a smell resembling rhubarb, yet they found it refreshing. The leaves of both these shrubs possess narcotic properties, and render beer heady. They are regarded as useful in agues, dysentery, and diarrhea.

LEDYARD, JOHN, 1751-89; b. Conn.; prepared himself for missionary labors, and was for a time among the Indians of the Six Nations. In 1776 he went to London, and accompanied capt. Cook on his third and last voyage. He was at this time a corporal of marines in the British service, and in 1782, when off the American coast, deserted, and endeavored to organize a n.w. trading expedition. In this he failed, and two years later again went to London, whence he undertook a tour of exploration in the extreme n. of Europe. Starting from Stockholm on foot, he traversed the coast-line of the gulf of Bothnia, and continued his course to Siberia. He was arrested at Irkutsk by orders of the Russian government, and expelled from the country with orders not to return under penalty of death. This harsh action appears to have been taken on the suspicion that he was a spy or on account of jealousy. He reached London with difficulty in a most forlorn condition, where he was kindly received, and by sir Joseph Banks and some other persons sent on an expedition of exploration to Africa. He reached Cairo, but was there attacked by a fit of sickness which put an end to his life. Ledyard's diary of his voyage with capt. Cook was published in an abridged form in Hartford, Conn., 1787. Others of his manuscripts were issued in London among the memoirs of the society for encouraging discoveries in central Africa. He possessed a restless temperament and an adventurous disposition, but his travels do not appear to have resulted in any considerable service to mankind. It is remarkable that he should have left his native country at the outbreak of the revolution, should have entered the naval service of Great Britain in a branch of it devoted to the comparatively peaceful duty of exploration, and should have deserted this service immediately after the close of the war between the two countries.

LEDYARD, WILLIAM, 1738-81; b. at Groton, Conn.; commander of fort Griswold, near New London, in 1781, defending the post with great courage against an overwhelming British force until it was taken by storm, when, with more than 100 of his soldiers, he was massacred by the enemy. A monument commemorates the event.

LEE, or **LEEWARD**, a nautical term for the quarter to which the wind is directed, as distinguished from *windward*, or the part whence the wind comes.

LEE, a co. in s.e. Alabama, having the Chattahoochee river for its e. boundary, drained by affluents of the Tallapoosa; about 610 sq.m.; pop. '80, 27,373—27,285 of American birth, 15,056 colored. It is intersected by 3 branches of the Western railroad of Alabama: the Selma, the West Point, and the Columbus. Its county seat is the terminus of the Savannah and Memphis railroad, and the East Alabama and Cincinnati. Its surface is uneven, with densely wooded hills and wide fertile plains. Its tillable lands are adapted to the cultivation of cotton, sweet potatoes, rice, sugar-cane, fruit, and the products of the dairy. It has fine pasturage for the raising of live stock. It produced in '70, 3,509 lbs. of honey. Number of farms in '70, 1,205, including 7 of 1000 acres and over. Cash value of farms in '70, \$1,405,738. Seat of justice, Opelika.

LEE, a co. in n.e. Arkansas, formed in 1873 out of parts of Monroe, St. Francis, and Phillips counties, and has the Mississippi for its eastern border; 1000 sq. miles. It is watered by the Languille, Blackfish, and St. Francis rivers, flowing through it from n. to s., and emptying into the Mississippi. It has a vast area of alluvial soil adjacent to the river banks, susceptible of cultivation when not subject to overflow. The climate resembles that of Louisiana in its humidity and forwardness of vegetation in the spring, and is said to be adapted to the cultivation of the vine and the silk-worm. A large extent of unsettled country is covered with a heavy growth of beech, denoting a rich soil, and there are groves of elm, hickory, and oak. Cotton is the staple article of cultivation; other products are fine maize, sweet potatoes, and the vegetables generally of Mississippi and Louisiana. Seat of justice, Marianna. Pop. '80, 13,288.

LEE, a co. in s.w. Georgia, having the Flint river for its e. boundary, is watered by two of its affluents, and intersected centrally by the Smithville and Albany line of the Southwestern railroad; 350 sq.m.; pop. '80, 10,577—10,566 of American birth, 8,839 colored. Its surface is generally level, and equally divided into plain and forest; its wooded elevations furnishing building timber of pine and oak. The product of its tillable lands is grain of all kinds, cotton, sweet potatoes, and sugar-cane. Some attention is paid to vine culture. Cash value of farms in '70, \$992,374, numbering 139, including 19 of 1000 acres and over. Seat of justice, Starkville.

LEE, a co. in n. Illinois, watered by the Rock river crossing the n.w. corner, and the Green river and Big Bureau creek rising in the county and flowing southward. The Chicago and Northwestern railroad traverses the n. portion, and forms a junction at Dixon with the Rockford and Rock Island and the Illinois Central railroads; 728 sq.m.; pop. '80, 27,494—22,347 of American birth. The country along Rock river is undulating, and partially covered with dense underbrush and scattering timber; the rest of the county spreads into broad, level prairies, inclining to be low and wet, but affording good grazing, pasture, and meadow farms. Stock raising is a remunerative business. Every kind of timber that prevails in Illinois may be found in the groves; and miles of hedge-fencing of the osage orange are planted every spring. In the central portion some Galena limestone is quarried. Indian corn, wheat, oats, flax, and sweet potatoes are the staple products. Total value of all farm productions, including stock, in '70, \$3,001,570. The principal industries are the manufacture of agricultural implements, carriages, dressed flax, iron castings, and woolen goods. Value of manufactures in '70, \$2,066,295. Seat of justice, Dixon.

LEE, a co. in s.e. Iowa, organized in 1837, has for its eastern boundary line the Mississippi river, on the n.e. the Skunk river, and on the s.e. the Des Moines, which empties into the Mississippi, at its southern extremity. It is traversed in the southern section by the Des Moines Valley railroad, and centrally by the Keokuk division of the Chicago, Burlington and Quincy railroad, and the Burlington and South-western; 500 sq.m.; pop. in '80, 34,859—28,930 of American birth. Hickory, walnut, and cottonwood trees grow on the river banks, and a few sycamores; a vast amount of locust has been raised. The surface is a succession of gentle elevations and depressions, with bold bluffs along the streams, and rich bottom-lands unsurpassed for fertility. The soil is a drift deposit, with a deep covering of vegetable mold. Considerable attention is paid to wool-growing, to fruit-culture, and the raising of fine cattle and horses. Beds of bituminous coal, gypsum and limestone for building purposes, appear on the banks of the Des Moines and Skunk rivers. Gypsum is found from 25 to 30 ft. in thickness. The Cardiff giant was manufactured from this deposit. Potters' clay is abundant, furnishing material for extensive potteries. The streams afford many excellent mill-sites. Pure well-water is easily obtained. Valuation of real and personal estate in 1870, \$20,000,000. Estimated value of farm productions, including additions to stock, etc., \$1,948,977. Value of manufactures, \$2,623,185. Seat of justice, Fort Madison.

LEE, a co. in e. Kentucky, watered by the middle, n. and s. forks of the Kentucky river, flowing into it from the n.w., is separated from the county on its eastern border by high ridges of mountains; 250 sq.m.; pop. '80, 4,254. Its surface is mountainous, but well wooded, and its valleys are fertile. Beds of bituminous coal and iron are found in the hilly region, and near the villages. Its productions include live stock, every variety of grain, tobacco, sweet potatoes, sorghum, maple-sugar, dairy products, and flax. It produced, in 1870, 3,118 lbs. of honey. Seat of justice, Beattyville.

LEE, a co. in n.e. Mississippi, intersected by the Mobile and Ohio railroad, is drained by the head waters of the Tombigbee river; 520 sq.m.; pop. '80, 20,461. Its surface is generally level, consisting of fertile plains, covered for long distances with a thick growth of hickory, elm, and oak, diversified by the tulip-tree and magnolia. Its soil, which has a substratum of limestone, is very productive, and adapted to the raising of live stock and every variety of grain, tobacco, cotton, sugar-cane, sweet potatoes, dairy products, and the vine. It produced, in 1870, 3,159 lbs. of honey. Cash value of farms in 1870, \$1,463,074, numbering 1970, including one of more than 1000 acres. Seat of justice, Tusselo.

LEE, a co. in s.w. Virginia, having for its s. boundary part of the state lines of Tennessee and North Carolina, and for its w. and n. the Cumberland mountains, separating it from Kentucky, about 450 sq.m.; pop. '80, 15,116—15,110 of American birth, 1005 colored. It is drained by Powell's river, rising in the county which bounds it on the n., and flowing s.w. through it into e. Tennessee. It is bounded on the e. by a range of mountains, through which is a natural tunnel 400 ft. in length. Stone mountain occupies part of the central portion, and the intervening valleys are very fertile, having a formation of limestone, and being well wooded with hickory, oak, ash, maple, and pine. Its agricultural productions include the raising of grain, sweet potatoes, sorghum, maple-sugar, and live stock. It produced, in 1870, 26,535 lbs of honey. Cash value of farms in 1870, numbering 930, \$2,184,205. It employs capital in flour-mills, tobacco-factories, and manufactories of woolen goods. Its mountains abound in coal, iron ore, limestone, sandstone, and saltpeter. Seat of justice, Jonesville.

LEE, a t. in w. Massachusetts, incorporated in 1777, among the Berkshire hills, in the co. of Berkshire, on the Housatonic river; pop. '80, 3,939. It is divided into East Lee, South Lee, and Lee Center; the two latter having stations on the Housatonic railroad. It is 110 m. from Boston, 115 m. from New York, 99 m. n. of Bridgeport, Conn., 11 m. s. of Pittsfield, Mass., and 38 m. s.e. of Albany. It has a national bank, a weekly newspaper, 8 churches, several hotels, a public library, and superior public schools. There are a number of woolen mills, but the principal industry is the manufacture of paper, employing 25 mills. It is celebrated for its ledges of fine, white marble, which has been extensively quarried to supply building material for exportation. This stone was used in the extension of the capitol at Washington, and in the erection of the Roman Catholic cathedral in New York. It is near the center of a district much resorted to in summer by urban residents, and which is noted for its delightful scenery and ancient air of respectability.

LEE, the name of a distinguished Virginian family. Their ancestor, RICHARD LEE, emigrated with a numerous household to America, in the reign of king Charles I., and settled in the country lying between the Rappahannock and Potomac rivers. He was a bold royalist, and during the protectorate of Cromwell was mainly instrumental in inducing the colony of Virginia to assume a semi-independent attitude.—RICHARD HENRY LEE, great-grandson of the preceding, and the most illustrious member of the family, was born at Stratford, in Virginia, Jan. 20, 1732. He was educated first at home, and afterwards in England. He did not come prominently before his countrymen till after the British parliament had passed (1764) the act declaring its right to tax the colonies, and also the stamp act (1765), when he immediately became the center of an active opposition among the colonists, associated himself with Patrick Henry (q.v.), and drew up most of the "resolutions" of the period. He was sent as a delegate from Virginia to the first American congress, which met at Philadelphia (Sept. 5, 1774), and at once became a leader in the assembly. He wrote most of those addresses to the king, the people of England, and the colonies, which compelled the great Chatham to admit that "for solidity of reasoning, force of sagacity, and wisdom of conclusion, under such complication of circumstances, no nation or body of men can stand in preference to the general congress at Philadelphia." When war between the mother-country and the colonies became inevitable, Lee was placed on the committees charged with preparing the munitions of war, and with devising all other means of offering a vigorous resistance to the British government. His labors at this time were enormous. On June 7, 1776, Lee made the most celebrated (and important) of all his speeches, when introducing before the congress of Philadelphia a measure declaring the "united colonies" to be "free and independent states," and "absolved from all allegiance to the British crown." During the war of independence, he was—in spite of ill-health—one of the most active of the patriotic party, chiefly, however, as a civilian. In 1784 he was elected president of congress, and when the federal constitution was established he entered the senate for Virginia. Towards the close of his career he became a decided federalist, although originally he had viewed that system of government with great suspicion, as tending towards a despotic centralization of power. In 1792 he retired from public affairs, and died in his native state, June 19, 1794. His *Life and Correspondence* was published by his great-grandson, R. H. Lee (2 vols., Philadelphia, 1825).—LEE, ARTHUR, youngest brother of the preceding, was born in Virginia, Dec. 20, 1740. He was educated at Eton, then studied medicine at Edinburgh, and after traveling on the continent for some time, returned to America, and started as a physician. Circumstances, however, soon drew him into the field of politics; he returned to England, advocated the

rights of the colonies in the English newspapers, and in 1776 took up his residence at Paris, as the secret agent of the American congress. In this capacity he was busily employed during the whole struggle, and conducted his business on the continent greatly to the advantage of the colonists. He died Dec. 12, 1792. Lee, like his brother, was an admirable scholar and writer, enjoyed the friendship of some of the most eminent men of his time—Burke, Wyndham, sir William Jones, the abbé Raynal, and the duke de Rochefoucauld. See *Life and Correspondence*, by R. H. Lee (2 vols., Boston, 1829).—LEE, HENRY, a distinguished American general, whose father was cousin of the preceding, was born in Virginia, Jan. 29, 1756. He was one of the most daring, vigilant, and successful cavalry officers on the side of the colonists. “Lec’s legion” was probably the most effective and courageous body of troops raised in America. In the famous retreat of Greene before lord Cornwallis, it formed the rear-guard, the post of honor, and covered itself with glory. At the battles of Guildford court-house and Eutaw, at the sieges of forts Watson, Motte, and Granby and Augusta, and at the storming of fort Grierson, Lee particularly signalized himself. After the war, he was sent to congress as a delegate from Virginia, advocated the adoption of a federal constitution, and in 1792 was chosen governor of Virginia. In 1809 he published a valuable work, entitled *Memoirs of the War in the Southern Department of the United States*. He died at Cumberland island, Ga., Mar. 25, 1816.—LEE, ROBERT E., gen. and commander-in-chief of the army of the confederate states of America, was a son of the preceding, and was born in Virginia about 1810. He was educated at the military academy of West Point, entered the army of the United States, served as capt. of engineers under gen. Scott in the war with Mexico, was raised to the rank of lieut.col., and brevetted col. for distinguished services. He was employed in the office of the commander-in-chief at Washington when Virginia seceded from the union, April, 1861, when he resigned his commission, and was appointed commander-in-chief of the forces of Virginia. When that state entered the confederacy, he was appointed to its highest military rank of gen., and though not the senior, was selected by president Davis as commander-in-chief. In July, 1862, he defended Richmond against the federal army under gen. McClellan, and after six days of sanguinary battles, drove him to the shelter of his gun-boats. Marching n., he defeated gen. Pope, Aug. 29, in the second battle of Manassas. Crossing the Potomac into Maryland, with a force of 40,000, he was met at Antietam by gen. McClellan with 80,000, and after a bloody but indecisive conflict, Sept. 17, recrossed the Potomac, and took a position at Fredericksburg, on the Rappahannock, where, Dec. 13, he was attacked by gen. Burnside, whose army he defeated with great slaughter. Gen. Hooker, the successor of generals McClellan, Pope, and Burnside, whom Lee had successively defeated, crossed the Rappahannock, May 1, 1863, and was attacked by gen. Lee on the 2d and 3d, routed with heavy loss, and compelled to escape in the night across the river. He afterwards carried the war into the northern states; but finally, being overpowered, he surrendered to gen. Grant. After the war he was appointed governor of Lexington college. He died Oct. 12, 1870, leaving a character extolled for integrity and piety. Lee married the adopted granddaughter and heiress of Washington, by whom he had five sons. See Lee’s *Life and Campaigns*, by his nephew, Ed. Lee Childe (1874).

LEE, ALFRED, D.D., a bishop of the Protestant Episcopal church; b. at Cambridge, Mass., Sept. 9, 1807; graduated at Harvard in 1827; admitted to the bar in 1830, and practiced for three years in Norwich, Conn.; after a course of study in the general theological seminary in New York, was ordained deacon in 1837 and priest in 1838; was rector of Calvary church, Rockdale, Del., 1838-41, when he was consecrated bishop of Delaware and became rector of St. Andrew’s in Wilmington. He has published *Life of St. Peter*; *Life of St. John*; *Treatise on Baptism*; *Memoir of Susan Allibone*; and *Harbin-ger of Christ*.

LEE, ANN. See SHAKERS, *ante*.

LEE, CHARLES, 1731-82; b. Cheshire, England. He entered the British army at 11 years of age; was in Braddock’s expedition, and wounded at Ticonderoga in 1758. He also served for a time in Portugal, but certain infelicities of temper hindered his advancement, and he never rose higher in the British service than a half-pay lieutenant. As a “soldier of fortune” he was more successful, having attained the position of aid-de-camp to the king of Poland and a maj.gen. In the Russian service against the Turks he became notorious chiefly as a duelist. In 1773 he emigrated to America, purchased an estate in Berkeley co., Va., and became an ardent whig. In 1775 he became maj.gen. of the continental army, took part in the defense of Charleston, and in 1776 was taken prisoner at Basking Ridge, N. J. It is now believed that, while in confinement, he made treasonable proposals to the enemy. In 1778 he was released by exchange, and in the battle of Monmouth his insubordination nearly lost the day. He was court-martialed and suspended from command for a year. Soon afterwards he was wounded in a duel by col. John Laurens, who challenged him for language disrespectful to Washington. After this he addressed a disrespectful letter to congress, and was punished by dismissal from the service. Died in Philadelphia.

LEE, CHARLES ALFRED, 1801-72; b. Salisbury, Conn.; graduated at Williams college, and in 1825 at the Berkshire medical college at Pittsfield, Mass.; settled in New

York, and was one of the founders of the Northern dispensary. He aided in founding the medical college of the New York university, and the Geneva medical college, in which and in many other medical institutions he was professor, chiefly of *materia medica* and *obstetrics*. He edited for several years the *New York Journal of Medicine*, and published several medical works. He edited the American edition of Copland's *Dictionary of Practical Medicine*. His medical works and contributions to medical periodicals are numerous.

LEE, ELIZA BUCKMINSTER, 1792-1864; b. N. H.; daughter of Joseph Buckminster, D.D., a clergyman in Portsmouth, and sister of Joseph Stevens Buckminster, an eminent clergyman and scholar. Under their supervision she acquired a superior classical education, and fondness for literary pursuits. She wrote the memoirs of her father and brother, published in 1849 and 1851, giving such clear insight into the higher New England character, that it was called by Thomas Carlyle a most valuable work. She married Mr. Thomas Lee, and passed her life in Boston and vicinity. She published, in addition to translations from B. Auerbach and other German authors, *Sketches of a New England Village*, (1837), a life of Richter (1842), and *Naomi, or Boston Two Hundred Years Ago* (1848).

LEE, EZRA, 1749-1821; b. Conn.; is remembered for a dangerous feat which he performed during the revolutionary war. The British war-vessel, the *Eagle*, was lying in the New York harbor, and it became necessary to make an effort to dislodge her from her position. Lee volunteered to fasten to her side one of David Bushnell's machines designed for blowing up vessels from under water. This machine was made to carry the operator and 150 lbs. of powder. The *Eagle* was a 64-gun ship, thickly sheathed with copper, and the attempt to fasten the infernal machine to her side was unsuccessful. Lee, however, performed his part of the duty faithfully, remaining under water for several hours, and on his return was warmly congratulated by Gen. Washington. He also fought bravely at Monmouth and in other battles.

LEE, FRANCIS LIGHTFOOT, 1734-97; son of Thomas; b. at Stratford, Westmoreland co., Va., Oct. 14, 1734; received an English and classical education from private tutors; was a member of the house of burgesses 1765-72, and of the continental congress 1775-79. He was one of the signers of the declaration of independence, often presided in committees of the whole, and was a member of other important committees of the congress. When the terms of peace with England were under consideration in 1783, he insisted most strenuously upon securing the right to the navigation of the Mississippi and to the Newfoundland fisheries. He took a prominent part in framing the articles of confederation which preceded the present constitution of the United States. He was a warm personal friend and supporter of Washington. After his retirement from congress in 1779, he served for a brief time in the senate of Virginia, but with this exception led a life of retirement.

LEE, FREDERIC RICHARD, R.A., an English landscape painter, b. at Barnstaple, in Devonshire, at the close of last century (1798), and first exhibited at the royal academy in 1824. He became an A.R.A. in 1834, and an R.A. in 1838. Lee is one of the most thoroughly national painters of his day, the characteristic scenery of his native country, its quiet river-banks, its parks, its leafy lanes, and its picturesque villages forming the favorite subjects of his pencil. Among his best known and most admired pictures are "The Broken Bridge," "The Mill," "The Watering-place," "The Fisherman's Haunt," "The Silver Pool," "The Plowed Field," "A Devonshire Village," "A Village Green," "Cover Side," "Harvest Field," "A Devonshire Lane," "Penshurst Avenue," "Avenue in Shobbrook Park." Among his latest works are "The Bay of Biscay," "Plymouth Breakwater," "View of Gibraltar from the Sands," "Land we Live in" (1867). In 1848 he began to paint a series of works along with S. Cooper, the cattle-painter—the former executing the landscape, and the latter the animals.

LEE, HANNAH F., 1780-1865; b. Mass.; daughter of Dr. Sawyer, an eminent physician of Newburyport. She married George G. Lee, of Boston, and for many years devoted her time to literature. In 1835 she published *Grace Seymour*, a novel, but nearly the whole of the edition was destroyed at the great fire in New York. In 1838, during a season of general financial distress, she published, anonymously, *Three Experiments of Living*, a work treating of the morals of domestic life. It met with remarkable success, and was widely circulated in England and other countries. Thirty editions were published in America. Among her best productions are *Old Painters*; *Luther and his Times*; *The Huguenots in France and America*; *Stories from Life for the Young*; and a *Memoir of Pierre Toussaint*. Her own name appeared for the first time, in connection with her writings, in the appendix to Miss Hannah Adams's memoir of herself, edited by Dr. Joseph Tuckerman.

LEE, HARRIET, 1756-1851; b. England; daughter of an actor of respectability, who had been bred to the law, and was careful to educate his daughters. She was the sister of Sophia Lee, with whom she was associated in an academy at Bath, which Sophia had established, called Belvidere House. With her sister she shares the honor of fostering the talents and predicting the eminence of sir Thomas Lawrence. Having secured a competence by the successful management of the school, on the retirement of her

sister she went to reside with her in the vicinity of Tintern Abbey, and afterward at Clifton, where she died, having survived her sister 27 years. She is chiefly celebrated for the joint authorship with her sister, of the *Canterbury Tales* (1797–1805), in 5 vols. A new edition appeared in New York in 1857. There are 12 tales, 8 of which she wrote. In 1821 her German tale, *Kruitzner*, was dramatized by Byron, and published, with due acknowledgment, under the title of *Werner, or The Inheritance*.

LEE, HENRY W., D.D., 1815–74; b. at Hamden, Conn.; ordained deacon in the Episcopal church in 1838; in 1840 became rector of a new church in Springfield, Mass.; in 1848 took charge of St. Luke's church in Rochester, N. Y.; in 1854 was consecrated as bishop of Iowa. Died in Davenport, Iowa.

LEE, JESSE, 1758–1816; b. in Prince George's co., Va.; founder of the Methodist Episcopal church in New England. He joined the Methodist church in 1773, and in 1783 was admitted to the conference as a preacher. In 1787 he visited New England and preached Methodism from Connecticut river to the farthest settlements in Maine. He formed the first Methodist class in New England, at Stratfield, Conn., Sept. 26, 1787, and the first in Boston, July 13, 1792. He was three times chosen chaplain of the U. S. house of representatives, and once of the senate. His principal work was a *History of Methodism in America*.

LEE, LUTHER, D.D.; b. at Schoharie, N. Y., 1800; became a preacher of the Methodist Episcopal church in 1827, and was one of those who at an early day espoused the anti-slavery cause, incurring thereby the active opposition of the leaders of the denomination. He was among those who, in 1843, withdrew from the Methodist church on account of its attitude upon the slavery question, and organized a new sect called the "Wesleyan Connection." He was president of the first Wesleyan Methodist general conference in 1844, and for several years edited *The True Wesleyan*, the organ of the new denomination. In 1856 he became president of Michigan Union college at Leoni, Mich., and in 1864 was appointed professor in Adrian college, Mich. In 1867 he returned to the Methodist Episcopal church, uniting with the Michigan conference.

LEE, NATHANIEL, 1657–1690; a dramatic poet, b. Hertfordshire, Eng.; educated at Trinity college, Cambridge; was an unsuccessful actor, and subsequently a dramatic author; became insane from habits of dissipation, induced by poverty and a wild imagination, and was confined in a lunatic asylum for four years; in 1688 was released on recovering his reason, and devoted himself to his former pursuits. Three years later he was killed, it is said, in a street night frolic. Of his 11 tragedies, *Theodosius*, *Alexander the Great*, *The Rival Queens*, *Mithridates*, and *Lucius Junius Brutus* were the best; the first two especially were long popular. His genius for tragedy is highly commended by Addison and others, but his metaphors were often extravagant and his style bombastic. He was an imitator of Dryden.

LEE, ROBERT, D.D., 1804–68; b. Tweedmouth, England; educated at the university of St. Andrew; ordained a minister of the Scottish church in 1832; settled at Arbroath in 1833, and at Campsie in 1836. When the church of Scotland was rent in twain, he remained with the Established church, was called to the pastorate of the Old Gray Friars' church in Edinburgh, and took a prominent part in the controversies that ensued. In 1844, to rebut the charge of Erastianism brought against the national church by the seceders, he translated and published with a preface of his own *The Theses of Erastus touching Excommunication*. In 1846 he was appointed regius professor of biblical criticism in the university of Edinburgh, and eight years later published the great work of his life—the fruit of most careful and earnest research—*The Holy Bible, with about 60,000 Marginal References and Various Readings, revised and improved*. He was charged by some of his brethren with unsoundness on the subject of eternal punishment, but defended himself with great vigor. He was a member of the deputation that appeared before a committee of parliament in 1858 on the subject of university reform, and had the satisfaction of seeing his suggestions embodied in the act that was finally passed. In 1859 he was arraigned before the presbytery of Edinburgh, and afterwards before the general assembly, upon the charge of introducing in public worship liturgical forms and postures unknown to the church of Scotland; the fact being that he had published a volume of *Prayers for Public Worship* and used the same in his own church. He defended himself with such power and eloquence that his accusers were defeated. In 1860 he published *The Reform of the Church of Scotland in Worship, Government, and Doctrine*, in which he presented his views of liturgical forms, postures, instrumental music, etc., and expressed his earnest desire, by certain changes in these and other particulars, to bring the church into more perfect harmony with the catholic Christian spirit and with the aspirations of the age. The general assembly of 1863–64 took action favorable to his views, and shortly afterwards an organ was erected in Gray Friars' church, a step which marked a new era in the history of the national church of Scotland. In 1865, however, the general assembly reversed its previous action, and the questions at issue were about to be tested in the civil courts, when Dr. Lee was attacked with paralysis, which led to his death, Mar. 12, 1868. His *Life and Remains*, by rev. R. H. Story, appeared in 1870.

LEE, ROBERT EDWARD (*ante*), 1807-70; son of col. Henry Lee of Westmoreland co., Va.; b. June 19, 1807; distinguished by the ability of the service rendered against his country as gen. and commander-in-chief of the armies of the confederate states. He graduated with honor at West Point in 1829; was lieut. in the engineer corps 1829-34; from 1834-37 assistant to chief engineer at Washington; in 1835 assistant in running the boundary line between Ohio and Michigan; 1837-41 superintending engineer of the improvements on the Mississippi and Missouri rivers; made capt. in 1838; in 1842 superintendent of the construction and repair of the defenses of the harbor of New York, assistant engineer at Washington, and member of the board of Atlantic coast defenses.

On the opening of war with Mexico in 1846, Lee was made chief engineer under gen. Scott, was in the battles of Cerro Gordo, Churubusco, and Chapultepec, and wounded in the latter. From 1852-55 he was superintendent of the West Point military academy. On the formation of a new cavalry regiment in 1855 Albert Sidney Johnston was made col., Robert E. Lee lieut.col., Hardee and Thomas majors, Van Dorn and Kirby Smith captains. Thomas is the only one of the number who was true to the national flag when the slave states rose against it. Lee was serving with this regiment in Texas in 1857, when on leave he returned to Washington, where, through his marriage with Mary Custis, great-granddaughter of Martha Custis, wife of Washington, he at that time came into possession of the Arlington estate near Washington. In Oct., 1859, he was ordered to suppress the John Brown raid at Harper's Ferry. From Feb. to Dec., 1860, he commanded the army department of Texas. In Mar., 1861, he was called to Washington by gen. Scott, with whom, during the most of the critical weeks when the secession movement was advancing with tempestuous rapidity at the south, he continued in the most confidential relations as an officer of the United States and a friend. On April 18, while the secession act was pending in the Virginia legislature, he informed gen. Scott that he must resign and go with his state if it seceded. The next day, before Virginia's secession act had passed, he cast the influence of his name into the scale of secession; sent in his resignation to gen. Scott, in a letter filled with grateful recognition of the general's friendship and the kindness of all his superiors in the service throughout his life, but without a word to indicate love of country. He but expresses the deep pain a man may feel at being obliged to take one side or another in a family quarrel—in parting with some dear friends to take side with others. The letter closes with this often quoted expression—"Save in defense of my native state I never again desire to draw my sword." How suicidal and absurd was that state allegiance, time has shown. A letter to his sister, a lady with a higher ideal of patriotism, shows the strange fact that he "recognized no necessity for this state of things." Exerting a wide influence by the native nobility of his character, and devotion to duty, he cast his fortunes with the most violent and determined defenders of human slavery as a divine institution, and became their great military reliance. It is an interesting question as to what mental idiosyncrasy induced a man of Lee's mold to take the step which made him the military hero of the most causeless of wars. The letter written to his sister, on the day when he resigned his commission, shows how little Lee's judgment led him, and how entirely he gave himself up to social considerations and the "states rights" theory. The letter is as follows:

"ARLINGTON, April 20, 1861.

"MY DEAR SISTER: I am grieved at my inability to see you. I have been waiting for a more convenient season, which has brought to many before me deep and lasting regret. Now we are in a state of war which will yield to nothing. The whole South is in a state of revolution, into which Virginia, after a long struggle, has been drawn; and *though I recognize no necessity for this state of things*, and would have foreborne and pleaded to the end for redress of grievances, real or supposed, yet in my own person I had to meet the question *whether I should take part against my native state*. With all my devotion to the union, and the feeling of loyalty and duty of an American citizen, I have not been able to make up my mind to raise my hand against my relatives, my children, my home. I have therefore resigned my commission in the army, and, save in defense of my native state, with the sincere hope that my poor services may never be needed, I hope I may never be called on to draw my sword.

"I know you will blame me, but you must think as kindly of me as you can, and believe that I have endeavored to do what I thought right. To show you the feeling and struggle it has cost me, I send a copy of my letter to gen. Scott, which accompanied my letter of resignation. I have no time for more. May God guard and protect you and yours, and shower upon you every blessing, is the prayer of your devoted brother,

"R. E. LEE."

After Lee had thus crossed the Rubicon to join the southern cause, his wife wrote to a friend: "My husband has wept tears of blood over this terrible war; but he must, as a man and Virginian, share the destiny of his state, which has solemnly pronounced for independence." The key to his betrayal of a patriot's duty lay in his family affection. His wife, from whom he had derived a great estate, exerted a powerful influence over him. The hearts of southern women, like those of the McGregors, beat high for caste and clan. The grandeur of the United States—the great republic of the world—paled before their eyes in the light that shone from the altar of their local prides and loves.

Lee was molded in the heat of his immediate surroundings. The question arises whether he could not have molded them instead—casting his influence with such quick and forcible decision for his *entire* country that he would have carried family and friends by the momentum of his own will, instead of being the reluctant victim of their infatuation.

On April 23, 1861, Lee was at Richmond, receiving an ovation in the legislative hall of Virginia on the occasion of the formal confirmation of his appointment by Gov. Letcher to the position of maj. gen. of the forces of the commonwealth of Virginia, which appointment had been made at once on the receipt of news of his resignation from the U. S. army. He remained without any specific command, superintending the fortifications of Richmond with a skill proved by subsequent events. His first operations in the field were against Gen. Rosecrans in western Virginia, which were ineffective. He was back to Richmond soon after, and was thence sent to South Carolina to meet the movement of the union forces at Port Royal. The latter part of May, 1862, when McClellan's army was threatening Richmond from the Chickahominy, Gen. Joseph E. Johnston was commander-in-chief of the confederate forces. At the battle of the Seven Pines, Johnston being wounded and disabled from command, Gen. Lee became the commander of the army of Virginia. Up to this time Lee had never had opportunity to display his ability on the field. He now maneuvered two considerable divisions of his army so as to give the impression that he intended to reinforce Jackson for an attack on Washington. McClellan was completely deceived. Lee suddenly concentrated all his force on the union lines, and in the battles of June 26 and 27 on the Chickahominy, notwithstanding the equal bravery of the army under McClellan, the superior generalship of Lee won a decisive victory. McClellan showed ability in retreat, and conducted the national army to a new line. On the 29th Lee ordered renewed attacks on the retreating army, but so skillfully and secretly had the union army retreated through White Oak swamp, and so resolute and skillful was their defense whenever attacked, that no advantage was gained by Lee's army. McClellan had time to complete his retreat, and on July 2 was intrenched on Malvern Hill. Here a desperate attack was made by Lee to dislodge him, which resulted in a bloody defeat of the rebel forces. Gen. Pope was soon after this put in command of the national armies in Virginia w. of Washington, while Gen. McClellan retained position on the James river. Lee, relying on McClellan's inactivity before Richmond, planned to throw his whole available strength against Pope. A series of rapid and unexpected blows fell upon the outer armies under Pope's command, his depot of provisions was captured, and on Aug. 29 and 30, 1862, Pope's main army was signally defeated on the same field of Manassas that witnessed the first defeat of Bull Run. Lee then projected the invasion of Maryland. To use Lee's own words, "the war was thus transferred from the interior to the frontier, and the supplies of rich and productive districts made accessible to our army." On Sept. 7 his entire army was near Frederick City. Lee's tactics were now to draw the union armies after him, and to choose his own ground and time for giving battle. On Sept. 8 he issued an address to the people of Maryland which shows how completely his feelings as a southern man and a slave-holder had dominated his naturally clear judgment. He uses the hackneyed phrases of secession journals in reminding the people of Maryland of their "wrongs"; in alluding to the supremacy of the national power over the local tendency to rebellion as "usurpation." To use his own language, "believing that the people of Maryland possessed a spirit too lofty to submit to such a government, the people of the south have long wished to aid you in throwing off this foreign yoke, to enable you again to enjoy the inalienable rights of freemen, and restore independence and sovereignty to your state." This appeal to personal liberty seems strange in the light of the terrorism towards all adverse opinion which prevailed throughout the confederacy. The proclamation had little effect. It is creditable, however, to Gen. Lee that his army, while in Maryland and Pennsylvania, were constrained to avoid all acts not in conformity with civilized warfare.

Gen. McClellan was now re-appointed to the command of the national armies. Sept. 10, 1862, Harper's Ferry was captured by the rebels preparatory to the invasion of Pennsylvania. McClellan followed Lee's movements, keeping the body of his army between Lee and Washington. By good fortune coming into possession of Lee's order of march, he forced the latter to turn. The battle of Antietam was the result. With a greatly superior force McClellan succeeded in inflicting such a blow that Lee was forced to abandon the invasion of Pennsylvania, but his superior generalship prevented the former from obtaining any further advantages as Lee retreated southward. On Nov. 7, 1862, McClellan was relieved of command. Lee had evidently relied much in carrying out his plans either offensive or defensive on the extreme caution of the union commander. The appointment of Burnside gave fresh activity to the national campaign. The government decided to renew the attempt on Richmond via Fredericksburg. Both armies were rapidly drawn southward, and on Nov. 20 Lee was gathering his entire army behind the works of Fredericksburg, while Burnside's covered the hills on the north, facing them. On Dec. 11 Burnside began the attack. On the 12th his army had achieved a good position. On the 13th a heroic assault was directed squarely against the fortified hills of Fredericksburg. It was hurled back with terrible loss to the union army. After this battle the army of Gen. Lee was not again molested until the campaign

of 1863 opened. Gen. Joseph E. Hooker had been appointed to supersede gen. Burnside, and with a powerful army now declared his intention to make quick work of ousting the confederate army from Fredericksburg. His army was double in numbers that of Lee. On April 29 he had massed six army corps on the n. side of the Rappahannock near Chancellorsville, and should have chosen his own battle-field. The genius of Lee was never more conspicuous than at this time. He took the initiative of attack before Hooker's army was through the "Wilderness," and detaching gen. "Stonewall" Jackson with 21,000 men to make a long circuit to the rear of the right flank of the union army, he occupied gen. Hooker with menaces in front until the evening of the 30th, when Jackson's attack fell like a thunderbolt from a clear sky on the rear of the union army. The next morning the attack was made real in the front, and such was the paralysis of the union commanders, and such the mastery of the time and place for action on the part of Lee, that the great army of Hooker was already defeated. But while the battle on that field was won, Lee received intelligence that the union gen. Sedgwick, at the head of 20,000 troops, had captured Fredericksburg and was now on the hill in his rear. On May 2 he turned his entire force back and attacked but did not dislodge him. But that night Sedgwick, hearing of the discomfiture of Hooker's army, retreated. On May 4 the whole union army was in full retreat, completely outgeneraled at all points.

Lee now organized his army to renew the invasion of Pennsylvania, and on June 3 commenced the advance with an army of 80,000 men. He maneuvered so as to force Hooker with all his army to follow, but at the same time so attenuated his line as to draw the following characteristic letter from president Lincoln to gen. Hooker: "*If the head of Lee's army is at Martinsburg and the tail of it on the plank-road between Fredericksburg and Chancellorsville, the animal must be very slim somewhere; could you not break him?*" But Hooker was evidently afraid of Lee anywhere, and with reason. The entire confederate army was transferred to North Virginia. On June 27 it was concentrated near Chambersburg. Gen. Geo. G. Meade now succeeded Hooker in the command of the national army, now n. of Washington. Lee's entire army was now in Pennsylvania. The national army concentrated towards Gettysburg. There gen. Meade brought Lee to battle and chose the field. On July 1 the battle of Gettysburg began by an unexpected collision between the union cavalry and the head of gen. Hill's column moving from Chambersburg towards Gettysburg. It resulted in the repulse of the union advance, and its retirement to the strong position of Cemetery ridge, s. of Gettysburg. The great battle was begun by Lee, July 2, 1863, at 4 p.m., by a tremendous cannonade followed by an impetuous attack on the right of Meade's position. It failed. The next day gen. Meade anticipated the strong attack to be made on his position, by an early retaking of a position gained by the confederates the day before. On the afternoon of the 3d Lee massed 145 cannon and opened the battle for two hours with their thunder, under cover of which his attacking columns of 15,000 men formed. The attack was all that human bravery could make it; but the column melted before the fire that waited for it; and though its head reached and covered the key of the struggle, the main force of the column was annihilated, and the position quickly retaken. Gen. Lee's noble equanimity was conspicuous in this defeat in the manner of his meeting the disorganized remnant of that returning column, infusing them with his own serene confidence. A retreat was now necessary, but it was deliberate and orderly, and gen. Meade, after his victory, found no place in Lee's army for attack. He maneuvered retreating until s. of the Rappahannock, where he endeavored to bring Meade to battle. But the latter was too wary. Then he advanced and endeavored to get to the n. of the national army, but Meade's counter-movements, prompt and rapid, prevented; and the latter in turn advanced, attacked and captured a part of Lee's force, compelling his retreat to the Rapidan. Here Meade planned an attack by surprise, but Lee received timely information, and when Meade's force confronted him, was in a position too strong to be attacked. With a quickness and boldness peculiar to him, he observed that Meade's army was in a weak position to resist an attack, and planned one for the following day. But the next day Meade and his army were no longer there. "They had disappeared like a phantom," writes gen. Lee's biographer. That ended the campaign of Virginia in 1863.

The "immense campaign" of 1864 for the possession of Richmond was now to test and crown the military fame of gen. Lee. Gen. U. S. Grant, victorious thus far on every field, assumed the personal command of the army of the Potomac. For an entire year all the vast resources at his command were used with that rugged grit that regards no loss of life too great which achieves the quick end of war, and with an energy and skill that all the world acknowledges. Yet during that entire year gen. Lee, with an army small in comparison, by his engineering skill, masterly handling, and invariable readiness, aided by his necessary concentration behind strong defenses, held Grant's army at bay, and yielded at last only as a cube of steel may yield to the last great pressure of a colossal vise. The year was filled with the sickening news of sanguinary battles with small results. Grant was hammering at the front of flint that Lee invariably presented. But the weakening force could but show their heroic valor and the resources of their commander. Gen. Lee surrendered the remnant of the army of Virginia on April 9, 1865. His parting address to his remaining troops is a model of sad dignity and grateful recognition of an army's constancy.

In Mar., 1866, gen. Lee was called before the reconstruction committee of congress to give his views. He was very guarded in the expression of opinions, but gave a hearty approval of what is known as president Johnson's policy. His answers to questions put to him were not particularly instructive, often vague and evasive, and have neither the ring of his military incisiveness nor the breadth of a statesman's view. They indicated his intention to give a mournful acquiescence, but not a support, to the re-formed union, and illy concealed the strength of his social aversion to northerners in southern society. But it must be stated that the questions put to him were often needlessly painful for him to answer, and called either for a pronounced adhesion to the lost cause, evasion, or renewed loyalty. His answers indicated the middle course.

In person gen. Lee was of the noblest type of manly beauty: tall, broad-shouldered, erect, with a dignity as impressive as that of Washington, yet not so cold; of habits as pure, more warmly religious; with a calm, confident, kindly manner that no disaster could change. The man was molded for the leader of a nobler cause than that of a confederacy whose corner-stone was human slavery. In the fall of 1865 gen. Lee had accepted the presidency of Washington college in Lexington, Va. Its sedentary duties and the habitual sadness of his proud spirit sapped his health, and a congestion of the brain terminated his life, Oct. 12, 1870.

LEE, SAMUEL, D.D., an English orientalist and linguist, was b., May 14, 1783, at Longnor, in Shropshire; studied at Queen's college, Cambridge, and took his degree of B.A. in 1817. Two years after he was chosen Arabic professor in the same university, obtained the degree of D.D. from Halle (unsolicited) in 1822 and from Cambridge in 1833, was appointed regius professor of Hebrew in 1831, and died rector of Barley, in Hertfordshire, Dec. 16, 1852. His *Grammar of the Hebrew Language* (2d ed., Lond. 1831), his *Book of Job, translated from the Original Hebrew* (3 vols., Lond. 1837), his *Hebrew, Chaldaic, and English Lexicon* (Lond. 1840), his translation from the Arabic of the Travels of Ibn-Batuta (Lond. 1833), have secured for him a very high reputation. His *Sermons on the Study of the Holy Scriptures* (1830) and *Events and Times of the Visions of Daniel and St. John* (Lond. 1851), are also highly esteemed. He took charge, for the British and foreign Bible society, of editions of the Syriac Old Testament, and of the Syriac New Testament, or Peshito, of the Malay, Persian, and Hindustani Bibles, and of the Psalms in Coptic and Arabic.

LEE, SAMUEL PHILIPS, Rear-Admiral U.S.N.; b. Va., 1812; entered the navy as midshipman in 1825; was appointed lieut. in 1837, commander in 1855, capt. in 1862, commodore in 1866, and rear-admiral in 1870. He rendered important aid in the capture of New Orleans during the war of the rebellion, being at that time in command of the North Atlantic blockading squadron. In 1864-65 he commanded the Mississippi squadron; 1866-67 he was president of the board to examine volunteer officers for admission to the navy; 1868-70, chief signal officer; commander of the North Atlantic fleet 1870-73, when he retired from active service.

LEE, SOPHIA, 1750-1824; b. London; daughter of an actor, and at 30 years of age wrote a comedy, *The Chapter of Accidents*, the profits of which enabled her to establish at Bath a seminary for young ladies, which was conducted for many years by her with the aid of her sister **HARRIET**, whose name is inseparably connected with her own in the authorship of *The Canterbury Tales*. Sophia, besides writing most of those tales, was the author of two novels and a tragedy that won a moderate success. Her second comedy was not so fortunate.

LEE, THOMAS, b. Va., about the beginning of the 18th c.; the third son of Richard, member of the council, and grandson of Richard, the cavalier founder of the family in America, who took an active part with Berkeley in securing the allegiance of the colony to the Stuarts. Thomas succeeded to the ancestral estate at Stratford, Westmoreland co. He became president of the council, and his commission as governor had just been signed, when he died, in 1750. By his wife Hannah, daughter of col. Philip Ludwell, a member of the council, he had six sons, all of whom were distinguished for public services rendered during the revolutionary war. **WILLIAM**, the fifth son, went to England as agent of Virginia, was elected sheriff of London in 1773 and alderman in 1775. He was afterwards diplomatic agent of the United States at the Hague, Vienna, and Berlin. He was recalled in 1779, and died at Green Spring, Va., June 27, 1795.

LEECH, *Hirudo*, a Linnæan genus of *annelida*, of the order *suctoria*, now forming the family *hirudinidæ*, and divided into a number of genera, some of which contain many species. They are mostly inhabitants of fresh waters, although some live among grass, etc., in moist places, and some are marine. They are most common in warm climates. The body is soft, and composed of rings like that of the earth-worm, but not furnished with bristles to aid in progression, as in the earth-worm; instead of which, a sucking disk at each extremity enables the leech to avail itself of its power of elongating and shortening its body, in order to pretty rapid locomotion. The mouth is in the anterior sucking disk. The mouth of many of the species, as of the common medicinal leeches, is admirably adapted not only for killing and eating the minute aquatic animals which constitute their ordinary food, but for making little wounds in the higher animals, when opportunity occurs, through which blood may be sucked. The mouth of the medicinal

leech has three small white hard teeth, minutely serrated along the edges, and curved so as to form little semicircular saws, provided with muscles powerful enough to work them with great effect, and to produce a triradiate wound. The stomach is very large, and is divided into compartments, some of which have large lateral caeca; and a leech which has once gorged itself with blood retains a store for a very long time, little changed, in these receptacles, whilst the digestive process slowly goes on. The circulating system consists of four great pulsating trunks, one dorsal, one ventral, and two lateral, with their branches; there is no heart. The aeration of the blood takes place by numerous small apertures on the ventral surface, leading into respiratory sacs. Leeches are oviparous, and each individual is androgynous. They have small eyes—in the medicinal leeches ten—appearing as black spots near the mouth, and of the most simple structure. Leeches frequently change their skin; and one cause of the great mortality so often experienced among leeches kept for medicinal use is the want of aquatic plants in the vessels containing them, among which to rub themselves for aid in this process, and for getting quit of the slime which their skins exude. Leech *aquaria* in which aquatic plants grow are therefore much more favorable for the health of leeches than the tanks and vessels formerly in use.—The MEDICINAL LEECH (*H. medicinalis* or *sanguisuga officinalis*) is a rare native of Britain; but leech-gathering is the occupation of some poor persons, particularly in Cumberland. Leeches, however, are generally imported from Hamburg and from the s. of Europe. The collecting of leeches gives employment to many persons in some parts of Europe; and leech-gatherers sometimes adopt the simple mode of wading into the water, and seizing the leeches which attach themselves to their bare legs. Pieces of liver, etc., are sometimes used for baits, and a kind of net is sometimes used. Some parts of Europe are supplied from more eastern regions. Slight differences have led to the establishment of two species—one more northern, and one more southern—among those commonly imported into Britain. The more northern—which is that above named—has the belly spotted with black; the more southern (*H. provincialis*, or *sanguisuga medicinalis* or *meridionalis*) has the belly unspotted. Other species are used for the same medicinal purpose of blood-sucking in other parts of the world. The ancients were well acquainted with leeches, but their medicinal use seems to have originated in the middle ages. Many millions of leeches are annually imported into Britain.—The HORSE-LEECH (*haemopis sanguisorba*) is common in Britain; it is much larger than the medicinal species, but its teeth are comparatively blunt, and it is little of a blood-sucker—notwithstanding the popular notion—and useless for medicinal purposes. It feeds greedily on earth-worms, which issue from the banks of the ponds or sluggish streams which it inhabits.—In many parts of India, as in the warm valleys of the Himalaya, the moist grass swarms with leeches, some of them very small, but very troublesome to cattle and to men who have occasion to walk through the grass. Sir James E. Tenneut's description of the land-leech of Ceylon (*haemadipsa Ceylonica*) is very amusing. In size, it is about an inch in length, and as fine as a common knitting-needle, but capable of distension to the thickness of a quill and a length of nearly 2 inches. It can insinuate itself through the meshes of the finest stocking. It is always ready to assail a passing traveler or quadruped. The coffee-planters are obliged to wear *leech-gaiters* of closely-woven cloth for protection. Horses are driven wild by these pests, “and stamp the ground in fury, to shake them from their fetlocks, to which they hang in bloody tassels.” The bare legs of palanquin-bearers are adorned with clusters of them like bunches of grapes. Their numbers have often occasioned the death of men compelled to spend days where they abounded. The moist valleys of Java, Sumatra, Chili, and other tropical countries swarm with land-leeches as much as those of India and Ceylon.

LEECH, JOHN, an English artist, was b. in London in 1817, and received his education at the charter-house. The reputation of this artist is almost entirely associated with *Punch*, to which, beginning about 1840, he contributed thousands of humorous sketches. These sketches are frequently as full of grace as of humor; the drawing is often excellent; and his female faces have a quiet, healthful beauty, which would be attractive in the ball-room, but more attractive by the fireside and with children on the knee. In the *Punch* sketches he has satirized keenly, yet, on the whole, humanely, the vagaries of male and female attire, the precocity of the young, the pomp of paterfamilias, the pride of domestic servants, and the singular relations which sometimes subsist between the parlor and the kitchen. To the future historian of the Victorian era these admirable sketches will be invaluable.

A collection of Leech's best contributions to *Punch* has been published separately, in several series, under the title of *Pictures of Life and Character*; also a volume of *Pencilings from Punch*. He died Nov., 1864.

LEECHING, or the application of leeches (q.v.), for the purpose of abstracting blood, is preferable to venesection or cupping in many forms of disease; as, for example—1. In local determinations of blood, unattended with febrile symptoms, as in acute inflammation of the female breast, when the pressure of the cupping-glass would cause intense pain. 2. In abdominal inflammations, especially in peritonitis (q.v.), the application of leeches is often preferable to general blood-letting, particularly in patients of a weak constitution. 3. In various organic affections of the heart and lungs, leeching often

affords great relief. Indeed, there are few diseases in which loss of blood is required, excepting erysipelas, in which the application of leeches is objectionable; although it is inexpedient, as compared with venesection, in those cases in which it is desirable to make an immediate impression on the disease (as in peritonitis in robust persons), or where the disease is very rapid (as in croup).

In the diseases of infants and young children, leeches must be applied with caution. Infants are sometimes completely blanched by the application of one or two leeches, and a case is recorded by Pelletan in which six leeches applied to the chest proved fatal to a child aged 6 years. In applying leeches, the part should be thoroughly cleaned, and the leeches, after being dried by rubbing them in a clean linen cloth, should be placed in an open pill-box or in a wine-glass, and applied to the spot at which it is desired that they should attach themselves. When it is wished to affix a leech to the inside of the mouth, it is placed in a narrow tube called a leech-glass. When the animals will not attach themselves readily, they may sometimes be induced to bite by moistening the part with milk or blood.

The quantity of blood which a leech is capable of drawing may be estimated at an average at about a dram and a half, although occasionally a leech will abstract between 3 and 4 drams; and this quantity does not include that lost after the animal has fallen off, which is frequently, especially in children, very considerable. In order to cause the leech to disgorge the blood, the usual practice is to apply salt to its body.

When the leeches have fallen off, it is usually desirable to promote to some extent the flow of blood from their bites, and this is readily done by the application of warm fomentations or poultices. The bleeding generally stops spontaneously after a short time; if it goes on longer than is desirable, mere exposure to the air, or the application of the fluff of a hat, or of a bit of cobweb, will usually check it, the fibrine of the blood coagulating on the applied filaments, and forming a small clot. If these means fail, a little cone of lint should be inserted into the bite, over which a compress should be laid and a bandage applied; or the bite should be touched with a stick of nitrate of silver (lunar caustic) scraped to a point.

Leeches, when applied to the mouth or interior of the nose, have been occasionally swallowed, and have given rise to very unpleasant symptoms. The best treatment in a case of this kind is to prescribe wine—half a glass, or even a glass, every quarter of an hour—which will speedily destroy the leech. A moderately strong solution of common salt would probably exert a similar fatal action on the animal.

LEECH LAKE, in n. Minnesota, about 7 m. s. of lake Cass. It is nearly 20 m. long and 15 m. broad. It has an elevation of 1330 ft., and discharges its waters by a short outlet into the Mississippi.

LEEDS, a co. in e. Ontario, Canada, having the St. Lawrence river for its s. and s.e. boundary; bounded on the n.w. by Rideau lake, and has other lakes of considerable size; 900 sq.m.; pop. 35,302. Through lake Rideau passes the Rideau canal, connecting Ottawa with Kingston on lake Ontario. The Rideau river takes its rise in the lake, emptying into the Ottawa river. The Cataraqui river also has its source in lake Rideau, emptying into lake Ontario at Kingston. Its surface is uneven. The soil is productive of wheat, oats, potatoes, corn, and rye. Its inhabitants are engaged in farming, manufacturing, and mercantile pursuits. The Brockville and Ottawa branch of the Canada Central railway has its terminus at the county-seat, and its s. and s.e. border is traversed by the Grand Trunk railway. Its capital is employed in foundries and machine-shops, tanneries, manufacture of stoves and white lead, flour and saw mills, and the making of buck and kid mits. Seat of justice, Brockville.

LEEDS, the first t. in Yorkshire and fifth in England in point of population, is a parliamentary and municipal borough, returning three members to the house of commons. It is situated in the n.w. of the West Riding of Yorkshire, in the valley of the Aire, and is the seat of important manufactures, especially of clothing. The woolen trade carried on here exceeds in extent that of any other part of England. It has been estimated that general goods to the annual value of £11,000,000 pass through the warehouses in Leeds. The staple manufactures are superfine broad and coarse narrow cloths, pelisse cloth, shawls, blankets, and Scotch camlets. At Holbeck, a suburb of Leeds, there is a flax-mill, the largest of the kind in Europe, which employs upwards of 2,500 hands. About 2,500 hands are employed in the worsted and silk trades. The manufacture of leather is carried on in some of the largest tanneries in the kingdom, and about 50 firms are engaged in making boots and shoes. The iron industries, which have been largely developed, employ about 15,000 persons. The other chief manufactures are those of glass, paper, tobacco, oil, chemicals, and earthenware. There are 34 churches in Leeds, 8 Roman Catholic and about 80 dissenting places of worship. The chief church is St. Peter's, which is in Kirkgate, and was rebuilt in 1838 at a cost of £29,770. It is 180 ft. long by 86 ft. wide; the tower is 139 ft. high, and contains a peal of 13 bells. It is a very noble edifice. The principal windows are of beautiful stained glass. It also contains some fine statues, one of which is erected in memory of those natives of Leeds who fell in the Crimea; the church has a good choir. The most interesting church in the town is St. John's, New Briggate, consecrated by archbishop Neale, A.D. 1634, an almost unique example of a "Laudian" church, and still retaining the original fittings. The

other principal buildings are chiefly of recent erection. The town-hall, completed in 1858, is 250 ft. long, 200 ft. broad, and the tower is 225 ft. high. It covers 5,600 square yards. The great hall is 161 ft. long, 72 ft. wide, and 75 ft. high. It is richly decorated, and contains one of the largest and most powerful organs in Europe, also statues of Edward Baines and Robert Hall, formerly members for the borough. There is also a colossal statue of the queen in the vestibule, and of Wellington in the front of the building. Kirkstall abbey, about 3 m. from Leeds, was founded between 1147 and 1153 by Henry de Lacie for the Cistercian order of monks. It is a fine old ruin, remarkable for its simple grandeur and unity of design. Adel church, about 4 m. from Leeds, is an interesting building, erected 1140. Near it was a Roman station, where several antiquities have been found. The general infirmary was erected in 1868 from designs by sir G. G. Scott, at a cost of £100,000, and contains accommodation for 300 in-patients. The mechanics' institute, erected in 1867, at a cost of £25,000, contains a lecture-hall accommodating 1700 persons. The free library, established in 1870 (under the free libraries act), contains 30,000 volumes. The grammar-school was built in 1859, at a cost of £13,000; it is built in the shape of a cross in the Gothic style, decorated period, and was designed by E. M. Barry, esq. The borough jail is a large castellated building at Armley, admirably adapted for its purpose. The corn exchange, a handsome building of an oval form; the post-office, formerly the court-house, near which is a statue of sir Robert Peel; the Queen's hotel, recently erected by the Midland Railway company; the philosophical hall, built in the Doric order of architecture, and having a fine museum; the Wesleyan training college, in the Gothic style, erected in 1868; Turkish baths (cost £14,000); Beckett's bank, a fine work by sir G. G. Scott, etc. There is also a library of 30,000 volumes, founded by Priestley in 1768. The number of subscribers is limited to 500. Among charitable institutions may be mentioned the dispensary; house of recovery; hospital for women and children; tradesman's benevolent society; industrial school; convalescent home; a handsome new workhouse; the reformatory at Adel, where about 60 juvenile criminals are usefully employed in agricultural and other occupations. Leeds has also a royal exchange, which was opened in 1876, a stock exchange, 2 general markets—one of which is a handsome structure of iron and glass—a cattle-market, colored and white cloth halls, 5 railway stations, 11 banks, 2 theaters, 4 daily and 5 weekly newspapers. Roundhay park, one of the most beautiful demesnes in England, at a distance of 2 m. from Leeds, was bought by the corporation of the town in 1872 at a cost of £140,000, and converted into a recreation-ground for the use of the public. It covers 733 acres, and contains a lake with an area of 33 acres. Pop. in 1871, 259,212; in 1878, about 300,000.

LEEDS. JOHN, 1705-90; b. Talbot co., Md.; served for forty years as clerk of the county and judge of the provincial court; in 1760 was appointed commissioner to supervise the returns of Mason and Dixon of the boundaries of Maryland and Pennsylvania. In 1769 he contributed to the *Philosophical Transactions* a paper on *The Transit of Venus*. He was appointed surveyor-gen. of Maryland, and performed the duties of that office until his death.

LEEK (*Allium porrum*; see **ALLIUM**), a biennial plant, and a native of the s. of Europe; with no proper bulb at the root, but generally a slight increase of the thickness of the stem; a stem about 3 ft. high, leafy at bottom; the leaves about an inch wide; the flowers in a large and very dense terminal globular umbel, which is not bulbiferous. It has been long in cultivation, and some of the varieties exhibit the effects of cultivation in greatly increased size and delicacy. The lower part of the stem, before it has run up into a flower-stalk, blanched by earthing up or other means which also induce it to swell and extend, is much esteemed for culinary purposes. Its flavor is much milder than that of the onion, or any other species of *Allium*. The leek has long been an especial favorite of the Welsh; and much attention has of late been paid to its cultivation in some parts of Scotland. It is generally sown in spring, and is used during the following winter. It delights in a rich but light and dry soil. Gardeners often transplant seedling leeks, instead of merely thinning out the original rows; and sometimes make deep holes for them with the dibble, into which they merely throw a little earth to cover the roots, leaving the stem to swell in the open hole.

LEEK, a manufacturing and market-t. of England, in the co. of Stafford, 24 m. n.n.e. of the town of that name. The parish church dates originally from 1180, and the town contains also numerous educational and benevolent institutions. Pop. '71, 11,331, who are employed chiefly in the manufacture of silk goods.

LEELANAW, a co. in central Michigan, surrounded by water on all but its southern border, is bounded on the n. and n.w. by lake Michigan, on the e. by Grand Traverse bay and West bay; 340 sq.m.; pop. '80, 6,253. It is drained by the Platte river, flowing into lake Michigan, and has two large picturesque lakes. Its surface is level, and well supplied with forests of sugar maple, beech, and hemlock. Its leading products are buckwheat, barley, oats, corn, rye, wheat, cattle, sheep, and swine. Its manufactures are not extensive, its fisheries claiming more attention. Seat of justice, Northport.

LEEMANS. CONRADUS, b. in the province of Gelderland, 1809; studied theology and archaeology at the university of Leyden, and in 1835 was appointed first conservator at

the museum of antiquities in that city. He devoted himself successfully to the task of gathering and arranging all the archaeological treasures of the city, and in 1839 was appointed director of the museum. At the same time he was commissioned by the governor to found an ethnographical museum, with which Siebold's Japanese collection was incorporated. He wrote historical and critical descriptions of the articles in the museum, especially of those belonging to the department of Egyptian antiquities.

LEER, a t. of Prussia, Hanover, in East Friesland, 32 m. w.n.w. from Oldenburg, on the right bank of the Leda, near its junction with the Ems. There are manufactures of linen, hosiery, etc.; breweries and distilleries; and ship-building yards. A railway, opened in 1856, runs northwards to Emden, and southwards to Papenburg, Osnabrück, and Münster. Pop. '75, 9,339.

LEES, FREDERICK RICHARD, b. 1815, near Leeds, Eng.; connected himself at the age of nineteen with the total abstinence enterprise, in which he soon became a prominent advocate. He received, 1841-44, several prizes for essays on his favorite subject, and in 1856, £100 from the United Kingdom alliance for an argument in favor of prohibiting the liquor traffic by legislation. He held public discussions with physicians. At the "world's temperance convention" in New York in 1853 he was a delegate from the British "temperance association" of the north of England. In 1860 he received a testimonial of 1000 guineas from friends of his cause in Great Britain. He published *The Metaphysics of Occicism dissected; a Treatise on Logic, or the Methods, Means, and Matter of Argument; History of Alcohol*. He edited for several years *The Truth Seeker in Literature, Philosophy, and Religion*.

LEESER, ISAAC, 1806-68; b. Westphalia. He emigrated to Richmond, Va., in 1824, and engaged in commercial pursuits, but in 1829 was appointed rabbi of a Jewish synagogue in Philadelphia. He published *The Jews and the Mosaic Law; Discourses, Argumentative and Devotional; Portuguese Form of Prayers; Descriptive Geography of Palestine*, from the Hebrew of rabbi Joseph Schwartz; and a *Translation of the Holy Scriptures (Jewish) from the Original Hebrew*. In 1843 he established *The Occident and American Jewish Advocate*, a monthly periodical; in 1850 retired from the ministry.

LEET COURTS, in English law, mean courts held in a manor, township, or hundred, for local purposes.

LEETE, WILLIAM, d. 1683; b. in England early in the 17th c.; emigrated to America in 1637; was an early settler in New Haven, Conn., and one of the founders of the town of Guilford. He was governor of the state 1661-65, and frequently a commissioner of the colonies between 1655 and 1679. He harbored and defended the regicides Goff, Whalley, and Dixwell in 1661, and was again elected governor in 1676, and annually thereafter until his death, at Hartford, 1683.

LEEUWARDEN, a t. of the Netherlands, capital of the province of Friesland, in a rich and extensive plain, on the Harlingen and Gröningen canal, 16 m. e.n.e. of Harlingen. It contains a handsome town-hall, an ancient palace of the prince of Orange, and many churches. Numerous canals intersect the town. Leeuwarden has a society for the investigation of Frisian history, antiquities, and language, and another for the study of natural history. Linen fabrics and paper are manufactured, and a trade in horses is carried on. Pop. '72, 26,264.

LEEUWENHOEK, or LEUWENHOEK, ANTHONY VAN, one of the earliest microscopic observers, was b. at Delft, in Holland, in 1632, and d. in the same town in 1723. The compound microscope, as it existed in his time, was very imperfect, and subject to many errors, which induced Leeuwenhoek to employ only simple microscopes, that is to say, very small lenses of short focal lengths, which were fixed between two plates of metal that had been pierced with a very narrow opening. He bequeathed to the royal society of London (where they are carefully preserved) a collection of these microscopes. It was in the *Philosophical Transactions* of this society, to which he contributed 112 papers, that most of his observations were originally published.

Amongst the most important of his investigations may be mentioned a memoir communicated to the royal society in 1690, in which he discovered, and clearly demonstrated, the continuity of the arteries and veins through intervening capillaries, and thus afforded ocular demonstration of the truth of Harvey's views regarding the circulation; he also examined the structure of the crystalline lens and of the brain. He is, perhaps, most generally known as the discoverer of the *rotifers*, and as being the first to recognize the property which these animals possess of alternately dying and being resuscitated, according as they are dried or provided with the water necessary for the maintenance of their vitality.

His writings were collected and published in Dutch at Leyden and Delft in seven 4to vols., the publication extending from 1686 to 1732. A Latin translation, under the title of *Opera Omnia seu Arcana Naturae*, was published at Leyden in 1792; and an English translation was published by Mr. Samuel Hoole, in two 4to vols., in 1798-1800.

LEEWARD ISLANDS. See ANTILLES.

LEEWAY. When a ship is steering in any direction, and a strong wind is blowing, so as to make an acute angle with the direction of the ship, the ship's actual course is

the resultant of two forces, one represented by her headway (or locomotive power), the other by the force urging her in the direction of the wind. This resultant must be somewhat between the two; and with the same power of wind, the angle between the direction in which the ship is steering and the resultant will be great or small as the headway is diminished or increased. This angle represents the leeway; and the amount of ground lost to leeward in a given distance sailed is shown by the side of the triangle subtending this angle. In all computations of the course pursued, allowance has to be made for leeway. Some ships, in tolerable weather, make scarcely any perceptible leeway, while bad sailors fall off as much as seven points of the compass.

LEFEBVRE, FRANÇOIS JOSEPH, Duke of Dantzig and marshal of France, was b. at Ruffach, in Alsace, Oct. 25, 1755. He entered the army at the age of 18, and was a sergeant in the French guards when the revolution broke out. He rose in rank with wonderful rapidity. He took part with Bonaparte in the *coup d'état* of 1799. In 1804 he was made a marshal of the empire. He also conducted the siege of Dantzig, and after its capture was created duke of Dantzig. He distinguished himself in the early part of the peninsular war, and suppressed the insurrection in the Tyrol. During the Russian campaign he had the command of the imperial guard, and in 1814 of the left wing of the army which resisted the advance of the allies in France. Submitting to the Bourbons after Napoleon's abdication, he was made a peer. He died Sept. 14, 1820.

LEFEBVRE-DESNOUETTES, CHARLES, Comte, 1773-1822; b. Paris; entered the French army, serving in Belgium in 1792, and afterwards as aid-de-camp to Napoleon at Marengo; distinguished himself at Austerlitz; in 1806 was made brigadier, and in 1808 general of division: at the siege of Saragossa was taken prisoner by the English, but escaped from England and took part in the Austrian, Russian, and German campaigns, and in defending France from invasion in 1804. He fought at Fleurus and Waterloo, and was made a peer by Napoleon in 1815. Being condemned to death by the royalists, he escaped to the United States, and united with baron Lallemand in the effort to establish a colony of French refugees in Alabama. He entered into correspondence with Napoleon at St. Helena with a view to effecting his rescue, and for his services received by the will of the emperor the sum of 150,000 francs. While on the voyage to France he was lost at sea near the Irish coast.

LE FÈVRE, FAVRE, or FABER, PIERRE, 1506-46; b. Savoy; was one of the nine original coadjutors of Loyola in the establishment of the order of Jesuits. He came of a peasant family, but was educated at the university of Paris, and at the college of Ste. Barbe, where he lectured on philosophy. Loyola was his pupil. He passed his ordination as a priest in 1534, and three years later induced the pope to permit Loyola and his companions to visit Palestine. He received the appointment of professor of theology in the Sapienza college in Rome in 1537, and the next year was sent to Parma on a special mission for reformation of the diocese. He afterwards visited Germany, where he conducted public disputations with the reformers; and in Spain and Portugal regulated the Jesuit college newly founded at Coimbra; and in Madrid, Valladolid, Valencia, etc., founded others. In 1546, on his way to join the council of Trent, he was seized with a violent fever, from which he died. After his death he was canonized, and a chapel erected in his memory.

LEFKOSI'A, called also NIKO'SIA, ancient LEUCOSIA, capital of the island of Cyprus (q.v.), is situated on the Pidias, in the center of an agricultural plain, about 35 m. inland from Famagosta bay. It is completely surrounded by walls, about 3 m. in circumference, and over 30 ft. high, and is entered by three gateways. It was fortified in the time of Constantine the great, but the old works were destroyed by the Venetians, who constructed the present fortifications. Lefkosia was taken in 1570 by the Turks, who massacred the greater portion of the inhabitants. It contains several buildings of interest, as the mosque of St. Sophia, the church of St. Nicholas, now converted into a granary, and the governor's palace. There is also a Latin convent, and a Mohammedan college with a library of oriental books. The kings of Cyprus of the Lusignan dynasty resided here. The streets are narrow, ill-kept, and badly paved. Lefkosia, under Turkish rule, was separated from the province in which it stands, and regarded as a fortress governed by a military chief; in 1878, when Cyprus came to be administered by Britain, it passed under civil rule, and is now the head-quarters of the civil commissioner for the province. The climate of the place is unsuited for Europeans. The manufacture of carpets, tanning, silk weaving, and saddlery are the principal employments. According to a census taken Jan., 1879, the pop. of the town was 11,197. Of this number, 5,628 were Mohammedans; 5,251 of the Greek church; Catholics, 121; Armenians, 166; English, 28; Jews, 3.

LE FLÔ, ADOLPHE CHARLES EMMANUEL, b. France, 1804. He was sent as ambassador to Russia from the French republic after the revolution of 1848; returned to Paris in 1849 an adherent of Louis Napoleon, but opposed his treachery to the republic. He was arrested after the *coup d'état* that made Napoleon dictator, and soon after banished; but allowed to return in 1859. After the fall of Napoleon, during the German war he was a short time minister of war, but resigned to take again the position of minister to Russia.

LE FLORE, a co. in n.w. Mississippi, formed since the census of 1870, of portions of the counties of Carroll and Sunflower; 560 sq. miles. Two branches of the Yazoo river unite in the central portion to form that stream, which is navigable to the county-seat of Greenwood. At this point steamboats are loaded with cotton, the staple product, to go down the river. Its soil is fertile when not subject to overflow, and its surface is diversified by dense forests growing on the river borders. The Yazoo river forms its southern boundary, where by dividing, and afterwards uniting some miles below, it forms Honey island. Seat of justice, Greenwood. Pop. '80, 10,246.

LEFORT, FRANÇOIS, was b. at Geneva in 1656. After serving for some time in the French and Dutch service, he went to Russia, where he obtained a captain's commission in the army. He fought with distinction against the Turks and Tartars, and took an active part in the intrigues which placed Peter the great on the throne. The czar never forgot Lefort, who became his chief favorite, and, next to Peter, the most important personage in Russia. He was a man of great acuteness and ability. He remodeled the Russian army, and also laid the foundation of its navy. In 1694 he was made admiral and generalissimo. When Peter the great undertook his visit to foreign countries in 1697, Lefort was the chief of the embassy, in the train of which the czar traveled *incognito*. Lefort died in 1699. See Golikof's *Vie de Lefort*, and the German monographs by Posselt (1866) and Blum (1867).

LEFT, THE; or THE MOUNTAIN (French, *La Gauche*, or *La Montagne*). See POLITICAL PARTIES, FRENCH.

LEFTWICH, JOEL, 1759-1846; b. in Bedford co., Va.; was a soldier in the revolutionary war, fighting gallantly at Germantown, Camden, and Guilford, and being severely wounded at the latter place. In the war of 1812 he commanded a brigade under gen. Harrison at fort Meigs; was afterwards a maj.gen. of militia, and frequently a member of the Virginia legislature.

LEG, THE, comprises all that part of the lower extremity which lies between the knee and the ankle. It consists of two bones, the tibia and fibula (see SKELETON and FOOT), and of masses of muscles (together with nerves and vessels) which are held in their position by coverings of fascia, and are enveloped in the general integument.

The shaft of the tibia is of a triangular prismatic form, and presents three surfaces and three borders. The internal surface is smooth, convex, and broader above than below; except at its upper third, it lies directly under the skin, and may be readily traced by the hand. The external and the posterior surfaces are covered by numerous muscles. The muscular mass forming the calf (formed by the *gastrocnemius*, *soleus*, and *plantaris* muscles) is peculiar to man, and is directly connected with his erect attitude and his ordinary mode of progression. The anterior border of the tibia, the most prominent of the three, is popularly known as *the shin*, and may be traced down to the inner ankle.

The fibula, or small bone of the leg, lies on the outer surface of the tibia, and articulates with its upper and lower extremities, and with the astragalus inferiorly. It affords attachments to many of the muscles of this region.

This region is nourished by the anterior and posterior tibial arteries into which the popliteal artery separates. Both these arteries occasionally require to be tied by the surgeon in cases of wounds or aneurism. The blood is returned towards the heart by two sets of veins—the deep, which accompany the arteries, and the superficial, which are known as the internal or long saphenous, and the external or short saphenous veins. These superficial veins are very liable to become permanently dilated or varicose (a condition the nature and treatment of which are considered in the article VARICOSE VEINS), if there is any impediment to the free transmission of the blood, or even from the mere weight of the ascending column of blood, in persons whose occupation requires continuous standing.

The nerves of the leg, both sensory and motor, are derived from the great sciatic nerve and from its terminal branches, the internal popliteal and the external popliteal or peroneal nerve.

In cases of fracture or *broken leg*, the two bones are more frequently broken together than singly, and the most common situation is at the lower third. The tibia is more often broken by itself than the fibula, in consequence of its sustaining the whole weight of the body, while the fibula has nothing to support.

LEGACY is a bequest or gift contained in the will of a deceased person of a chattel or sum of money or other thing. In England, it is provided by statute that if a legacy is given to the witness of a will, or to his or her wife or husband, the legacy is void; therefore, a legatee should never act as a witness. So bequests to superstitious uses are void, as, for example, to maintain a priest, or an anniversary or obit, or a lamp in a church, or to say masses for the testator's soul, or to circulate pamphlets inculcating the pope's supremacy. Legacies of money for charitable purposes, as for the use of schools, churches, etc., are valid, but if the money is directed to be laid out in the purchase of land for such purposes, the legacy is void by what is called the mortmain act (q.v.), 9 Geo. II. c. 36. The policy of this statute has often of late been questioned, and it is enough to say that there is a mode, often practiced, of evading it.

Legacies are divided into specific and general. A specific legacy means a legacy of a specific thing, as a particular horse, picture, silver-plate, etc., or a sum of stock in the funds. A general legacy means a sum of money, without saying out of what fund it is to come, and it is payable out of the assets generally. The important difference between the two kinds of legacy is this, that if the subject-matter of the specific legacy fail, as if the horse die or be previously sold, etc., the legacy is gone, and no compensation is given for it; while, on the other hand, if there is not enough to pay all the general legacies, then they must abate—that is, share the loss—whereas the specific legacy, if it exist, must still be paid in full. There are various rules of great nicety and intricacy connected with the proper construction of legacies in a will, which are too technical to be noticed. It is a general rule, applicable to all legacies, that they are only payable if there is money enough for the purpose, after paying all the testator's debts, for the maxim applies, that a man must be just before he is generous. The rule is, that a legacy is not payable by the executor till a year has elapsed after the testator's death, for it is presumed he requires this time to inquire into the state of the property; and this is true even though the testator has ordered the legacy to be paid within six months after the death. If a legacy is left to an infant under twenty-one, it cannot be paid to the father, or any other relation, without the sanction of the court of chancery. If a legacy is left to a married woman, the husband was entitled to claim it, unless it was left to her separate use, or unless she was unprovided for by the husband; but now, in all cases, the wife gets for her separate use all property coming to her. Interest is due on legacies from the time when the principal sum is payable—i.e., one year after the death—unless otherwise specified. If the legatee die before the testator, the legacy lapses—that is, becomes void; but there are some exceptions, as where the legatee is a child or grandchild of the testator.—In Scotland, the rules as to legacies are mainly the same, but not entirely. The details are too technical to require notice here. See Paterson's *Compendium of English and Scotch Law*, p. 233. In Scotland, a legacy can be enforced in six months after the testator's death, and bears interest from such death. If a legacy is left to a married woman, the husband is now in general bound, as in England, to settle it on the wife, by the statute 24 and 25 Vict. c. 86.

In the United Kingdom, a legacy or succession duty is levied on the amount of all legacies (except to husband or wife). Children and issue, also parents and ancestors, pay one per cent duty; brothers and sisters, and their issue, pay three per cent; uncles and aunts, and their issue, pay five per cent; granduncles, etc., and their issue, pay six per cent. Strangers in blood, and distant relatives, also illegitimate children, pay ten per cent. *

LEGACY (*ante*). Legacies are of various kinds; as, absolute, to vest at once unconditionally; conditional or contingent, limited to take effect upon some event which may or may not take place; demonstrative, to be paid out of a specified fund; model, where the will contains directions as to the way in which the legacy shall be applied to the use of the legatee; residuary, of all the personal property of the testator, not otherwise disposed of, etc. In regard to the construction of legacies, the rule is that the plain intent of the testator as collected from the whole will shall be carried into effect. Where the legatee is incorrectly described, the error may be corrected if a reference to the will itself clearly make out the testator's intent; but parol evidence is inadmissible to remedy such misdescription unless it appear that there are two persons to whom the description in the will may apply. Where a bequest is made to children, the term, unless otherwise specified, is held to mean children at the time of the testator's death, and to include a child in its mother's womb, but not illegitimate children when there are legitimate children who answer the description in the will. Whenever the estate is unable to discharge the debts and specific legacies, the general money legacies are abated proportionately; and specific legacies are themselves liable to be abated if the debts be not yet discharged. Legacies are subject to ademption, i.e., to be destroyed or withheld on account of some act of the testator indicating an intention to revoke the bequest; thus, where a testator gives a legacy to a child and afterwards makes a settlement on her, the settlement is regarded as an ademption of the legacy. When two legacies are given to the same person, the question arises whether he shall take both. It has been held that where two legacies of unequal value are given to the same person by one will, or where legacies of equal or unequal value are given to the same person by different wills, he is entitled to receive both legacies; where the same thing is given twice, or legacies of equal value are given to the same person by the same will, he is entitled to receive but one legacy. Where a testator gives a legacy to his debtor as much as or more than the debt, the legacy, in the absence of evidence to the contrary, is presumed by courts of equity to be in satisfaction of the debt; but a legacy to a debtor will not constitute a release of the debt unless it be clearly shown that such is the intention of the testator.

LEGAL, or **LEGAL REVERSION**, in Scotch law, means the right of redemption of an adjudication of heritable property, equivalent in England to equity of redemption of a tenant *in elegit*.

LEGAL TENDER. See **MONEY**.

LEGARÉ, HUGH SWINTON, 1797-1843: b. Charleston, S. C.; of Huguenot extraction. He studied law for three years, and then visited Edinburgh, where he completed his

education, traveling afterwards on the continent. Returning home, he devoted himself to farming for a time, near Charleston, and then began the practice of law in that city. He was elected to the legislature of South Carolina, and was afterwards attorney-general, being at the same time editor of the *Southern Review*. In 1832 he was sent to Belgium as *chargé d'affaires*; was a member of Congress from 1837-39; and from 1841 until his death, was attorney-general of the United States. He favored state rights, but was an opponent of nullification. His writings, collected and edited by his sister, were published in 2 vols. after his death.

LEGATE, the name of the ambassador or representative, whether temporary or permanent, sent by the pope to a particular church. In the ancient church we meet many examples of officials, called in Greek *apocrisiarioi*, and in Latin *responsules*, at the court of Constantinople; but their commission was commonly temporary, and granted for some special object. In the later constitution of the church, three classes of legates are distinguished. 1. *Legati a latere*, "legates dispatched from the side" of the pontiff, who are commonly cardinals; 2. *Legati missi*, called also "apostolic nuncios," and including a lower grade called "internuncios;" 3. *Legati nati*, "legates born," whose office is not personal, but is attached by ancient institution or usage to the see or other ecclesiastical dignity which they hold. Of the last class there were examples in most national churches; thus, the bishop of Thessalonica was legate born for Illyricum, the bishop of Aries for Gaul, the bishop of Mainz for Germany, the bishop of Toledo (though his claim was often disputed) for Spain, the bishop of Canterbury for England, etc. This institution, however, has gone entirely into abeyance; and, indeed, the authority of legates is much modified in the modern church. In the mediæval times, the legate claimed full papal jurisdiction in the country assigned to him, even overruling the local jurisdiction of the bishops of the national church. This led to many disputes; to refusals to receive legates, as in France, where the legate was obliged to wait at Lyons till his credentials should have been examined and approved at court; and to counter-legislation, as in England, to the statute of 16 Richard II., commonly known as the statute of *premunire*; and the council of Trent removed the ground of contention by abolishing all such claims to local jurisdiction as trenced upon the authority of the bishops. The legate, in the modern church, is little other than the ambassador, mainly for spiritual purposes, of the pope. He is held as belonging to the diplomatic body, and by the usage of Catholic courts enjoys precedence of all other ambassadors. The legates at the second-rate courts have the title of *internuncio*. Legates are commonly bishops or archbishops, in *partibus infidelium*. The establishment of a nunciature at Munich, in 1785, led to an animated controversy. In the pope's own states, as they existed before the late revolution, the governors of the legations (see ITALY, PAPAL STATES) were called *legates*.

LEGATE AND LEGATION (LEGATE, ante). As commonly used in modern times the word legate is applied to the person charged by the pope of Rome to represent him, or the Roman church, at the seat of government of a foreign country, or at the seat of a bishopric of the church. But the word need have no such restricted use. It was employed by the Romans under the republic, before the church controlled Rome, to indicate any person sent by the government on a special mission of importance to another government, or even to a conquered province; when a legate frequently became acting governor by virtue of such commission. *Legatus* among the Romans was a synonym of ambassador. Envoy-extraordinary, legate, ambassador, are three words signifying nearly the same thing: the first two indicating a fresh or special appointment for a specific object, and the last a more permanent mission. The term legation includes all that appertains officially to the position of a legate, an ambassador, or an envoy-extraordinary, viz., his secretaries, attachés, family, and residence. We speak of the residence of the American legation, but by "a call at the legation" one may mean a call on any officer or any of the families of the officers of the legation, meaning then by legation the seat of residence of its members.

LEGA'TO (Ital. *tied*), in music, means that the notes are to be played as if bound or tied together, or in such a manner that the one note is as it were rounded off, or flows into the following one. Many musicians think that legato passages should be played slower, which is a great mistake. Wherever *legato* is marked, either as the character of the whole piece, or only over a part of the notes, it is the sign that the music requires to be performed in a flowing manner, and without any interruption between the striking of the notes.

LEGA'TUM REI ALIE'NÆ, in the Roman law, is the legacy of a thing which does not belong to the testator. In England and Ireland such a legacy is simply null and void; but in Scotland the Roman law has been adopted, by which, if the testator knew the thing bequeathed was not his own, the executor is bound to purchase something else, as compensation to the legatee.

LEGEND (Lat. *legenda*, things to be read, lessons) was the name given in early times, in the Roman Catholic church, to a book containing the daily lessons which were wont to be read as a part of divine service. Then the narratives of the lives of saints and martyrs, as well as the collections of such narratives, received this name, because

the monks read from them at matins, and after dinner in the refectories. Such legends were also inserted in the breviaries (see BREVIARY), in order that they might be read on the festivals of the saints and martyrs. Among the mediæval collections of legends, that drawn up by the Genoese archbishop, Jacobus de Voragine, in the second half of the 13th c., under the title of *Legenda Aurea* (the Golden Legends), or *Historia Lombardica*, is the most celebrated. But the most comprehensive and valuable work on the subject is that commenced by the Bellandists (q.v.) in the 17th c.—*Acta Sanctorum* (q.v.)—and still going on. The way in which a credulous love of the wonderful, exaggeration of fancy, and ecclesiastical enthusiasm, at times even pious fraud, mixed themselves up in these narratives with true history, caused stories of a religious or ecclesiastical nature generally to be designated as legends, in contradistinction from authentic ecclesiastical history; and thus the word "legends" also serves to separate religious from secular traditions, and from those wild tales (Ger. *märchen*) that delighted the peasantry of mediæval Europe. Legends in this sense of the word, as spiritual or ecclesiastical sagas, are found not only in the Roman Catholic but also in the Greek church, and their origin reaches back to the earliest ages of Christianity—Christ himself, the Virgin, John the Baptist, the apostles, and other prominent persons of the gospel history having become, at a very early period, the subject of them. But this tendency to mythic embellishment showed itself more especially in regard to Mary, the later saints, martyrs, and holy men and women. From the ecclesiastical literature of the eastern and western churches, especially of the latter, the legends also found an entrance into the *national* literature of Christian nations. Among the Germans this was very markedly the case after the second half of the 12th c., although specimens of legendary poems are not altogether wanting at an earlier period. We may mention, for example, the *Kaiserschronik* (Imperial Chronicle), where the legendary element forms a very important part of the whole; and Werner's versified *Marienleben* (Life of Mary), written in 1173, etc. The authors of these works were ecclesiastics; but already laymen, too, had appeared in the same field. The poetic versions of the legend of St. Oswald and that of Pilate sprung from this class; and in the following age, when the mediæval poetry of Germany was in its richest bloom, and the fosterers of the poetic art were emperors and princes, rather than ecclesiastics, the legend was employed by laymen on a grand scale, as the subject-matter of epic narratives. Thus, Hartmann von Aue (q.v.) worked up into a poem the religious legends about Gregory; Konrad von Fussesbrunnen, those concerning the "childhood of Jesus;" Rudolf von Ems, those about "Barlaam and Josaphat" (q.v.); and Reinbot von Durne, those about "St. George." Between the 14th and 16th centuries, legends in prose began also to appear, such as Hermann von Fritzlar's *Von der Heiligen Leben* (written about 1343), and gradually supplanted the others. Finally, in the 16th c., when Protestantism began to powerfully influence the whole of German literature, the legend disappeared from German poetry, or passed over into the moral-didactic and also the comic narrative, in which form it was employed by Hans Sachs with the happiest effect. Numerous attempts have been made to resuscitate it in modern times. The first of the recent poets who clearly apprehended the poetic and spiritual elements of the old Christian legend was Herder (q.v.); and since his day many German poets—for example, the "Romantic School"—have endeavored to give these a new embodiment.

LEGENDRE, ADRIEN MARIE, an eminent French mathematician, b. at Paris in 1752. He obtained, in 1774, a professorship of mathematics in the military school at Paris, and in 1783 was admitted a member of the academy. In 1787 he was employed by the French government, along with Cassini and Mechain, in measuring a degree of latitude, and was chosen to perform the calculations after the work of observation had been finished. In 1808 he was appointed by the imperial government president for life of the university, and after the second restoration an honorary member of the commission for public education, and chief of the committee of weights and measures. But because in an election to a place in the academy he did not vote for the ministerial candidate, he was deprived, in 1824, of his pension of 3,000 francs. He died Jan. 9, 1833. Legendre is the author of *Théorie des Nombres* and *Éléments de Géométrie*, and particularly distinguished himself by his investigation of the difficult subject of the attraction of the elliptic spheroid, and of a method for determining the paths of comets.

LEGER-LINE, a kind of tackle used in fishing. It consists of a bullet or piece of lead with a hole through the center, through which a gut-line is threaded, having at the end of it a hook. About 18 or 20 in. above the hook a shot or bead is fastened firmly to the line to prevent the lead from slipping down the line nearer to the hook. The hook being baited, the tackle is then cast into the water. The lead rests on the bottom, and the line is kept tight, but without lifting the lead off the bottom. The moment a fish bites at the bait, it is felt by the angler, who immediately gives a strong pull or strike. This method of fishing is used chiefly for barbel or bream.

LEGER-LINES, in music, the name of those short lines above or below the staff, which are used to express those notes which extend beyond the five lines of the staff.

LEGGE, JAMES, LL.D., b. Huntly, Aberdeenshire, in 1815; graduated at King's college and university in 1835; studied subsequently at Highbury theological college, London, and received from the university of Aberdeen the degree of LL.D. in 1870. In 1839

he was appointed by the London missionary society a missionary to the Chinese, and reached Malacca in Dec. of the same year. In 1840 he took charge of the Anglo-Chinese college founded by the rev. Dr. R. Morrison in 1825. In 1843 he removed to Hong-Kong, where he discharged missionary duties, and officiated as minister of the English union church until 1867, when he visited England. While in England he was presented by the government of the colony with a service of plate "in acknowledgment of many valuable public services freely and gratuitously rendered." He was presented also by many of the Chinese inhabitants with a valuable and beautiful silver tablet, made after the Chinese fashion. In 1870 he returned to Hong-Kong. In 1875 some gentlemen connected with the China trade formed themselves into a committee to establish a chair of the Chinese language and literature at Oxford, to be occupied first by Dr. Legge. The university responded to the proposal, and the chair was constituted in Mar., 1876. Dr. Legge took a prominent part in the discussions held in 1847, in China, about the proper rendering in Chinese of the words God and Spirit, and published a volume in 1852 under the title of *The Notions of the Chinese concerning God and Spirits*. His chief work is an edition of the Chinese classics with the Chinese text, a translation in English, notes critical and exegetical, and copious prolegomena. He was led to prepare this, he says, in 1811, from a conviction that he "should not be able to consider himself qualified for the duties of his position until he had thoroughly mastered the classical books of the Chinese, and had investigated for himself the whole field of thought through which the sages of China had ranged, and in which were to be found the foundations of the moral, social, and political life of the people." His plan was to embrace what are called "the four *S'u*," and "the five *King*." The *Shu* were published in 2 volumes in 1861. Three of the *King* have been published, and with these are translations of various other important ancient Chinese works. For these works the Julien prize, on occasion of its first award, was given to Dr. Legge by the *Académie des Belles Lettres et Inscriptions* of the institute of France in 1875. He attended the congress of orientalists at Florence in 1878.

LEGGETT, MORTIMER D., b. Ithaca, N. Y., 1831; emigrated to Ohio in 1847, where he entered the legal profession, settling at Zanesville. He was superintendent of schools in that city at the beginning of the rebellion in 1861, when he raised an infantry regiment, of which he was appointed col. in Jan., 1862. He led this regiment, the 78th Ohio, at Fort Donelson, Pittsburg Landing, and Corinth. He commanded at the capture of Jackson, Tenn., and defended Bolivar against a superior force. He was made brig. gen. of volunteers in 1862; was severely wounded at Champion Hills and Vicksburg, but took part in the Atlanta campaign and in Sherman's march to the sea, and for gallant conduct in the latter was brevetted maj. gen., and afterwards promoted to a full major generalship. He was appointed commissioner of patents in 1871.

LEGGETT, WILLIAM, 1802-39; b. New York; educated at Georgetown, D. C.; was midshipman in the navy, 1822-26; published in 1825 *Leisure Hours at Sea*, a volume of poems written while in the navy; became in 1828 editor of the *Critic*, a weekly journal, which was afterwards united with the *New York Mirror*. Several articles of his which appeared in the *Mirror* and other magazines he subsequently published in a volume with the title of *Tales by a Country Schoolmaster*, which was followed by *Sketches at Sea*. In 1829 he became one of the editors of the *Evening Post*, continuing till 1836. He denounced those who mobbed the abolitionists in 1835, earnestly defending the right of free discussion. Retiring from the *Post*, he established the *Plaindealer*, a weekly journal, which had a large circulation, but was continued only a year. In 1839 he was appointed by president Van Buren diplomatic agent to Guatemala, but died suddenly at New Rochelle while preparing for his departure. Two volumes of his *Political Writings* were published after his death, with a memoir by Theodore Sedgwick. Mr. Leggett was a fearless advocate of freedom of opinion and discussion, and Mr. Bryant wrote a highly eulogistic poetical tribute to his memory.

LEGHORN, a province of Italy, comprising a city of the same name, on the w. coast in the division of Tuscany, with the island of Elba in the Mediterranean sea, between that country and the island of Corsica, and bounded on the e. by the channel of Piombino. The surface of the island of Elba (17½ sq.m.; pop. '72, 21,755) is hilly, and the soil is very fertile. Much attention is paid to the cultivation of fruit, and especially the vine. Iron ore is found. The n.e. portion of the province, containing the city of Leghorn, is a point of land projecting into the sea; 109 sq.m.; pop. '72, 97,096—10,000 Jews.

LEGHORN (*Livorno*), one of the chief Mediterranean seaports, is a city of Tuscany, in the modern province of Livorno, 50 m. w.s.w. of Florence, and 14 m. s.s.w. of Pisa; lat. 43° 32' 7" n., long. 10° 17' 7" e.; pop. '71, of Leghorn, 80,914; or including its three suburbs, Torretta, Sta Lucia, and S. Jacopo, 89,462.

Till 1868 Leghorn was a free port, and it has long been one of the leading emporiums of trade in Italy. Its import trade used to be estimated at £2,000,000 yearly, the chief imports being from England and France. Ever since the abolition of its privileges as a free port, the trade of Leghorn has not been lessened, but only changed in character. It is now less a port of deposit than of transit to and from the interior of the kingdom. The town is partly intersected with canals, by which merchandise is conveyed from the

harbor to the numerous warehouses of the city. The port consists of an inner and outer harbor, the latter being sheltered by a mole, which projects into the sea upwards of half a mile, close to the great light-house. To secure increased shipping accommodation, a new harbor has been constructed for the reception of vessels of considerable tonnage. The roadstead, which is capacious, lies w.n.w. of the harbor, and is protected by towers and a castle. On an island s. of the harbor stands the lazaretto. The town is connected by railways with Rome, Pisa, Carrara, and the other parts of Italy.

The pop. comprises natives of many climes (Greeks, Armenians, Turks, Moors, etc.), whose foreign appearance and striking garb give a picture-sque appearance to the place. This concourse of strangers is further enlarged in the summer season by a great influx of native and foreign visitors, who resort to Leghorn for its baths and mineral spring, the latter of which enjoy high medical repute. The town itself is chiefly of modern origin, and destitute of the grand historical associations and classical monuments which invest most Italian cities with their highest interest; its fine Mediterranean site, animated aspect, and great commercial life are its principal attractions. The streets are regular and well paved, but narrow, and, in consequence of being flanked by high houses, they are for the most part dark and gloomy. The churches are numerous. Many of the private dwellings of Leghorn are tasteful and luxurious, and charming villas abound in the environs. The public institutions are well organized, and include three hospitals, an observatory, a poorhouse, and a free library. Some years ago, the circuit of the town was extended by the demolition of old fortifications, and the extension of the barriers or city walls. The manufactures of Leghorn are various and important; it possesses great factories of oil, tobacco, soap, salt, and the well-known liquor *Rosolio*; its distilleries and dyeing works are also celebrated. Its chief exports are raw and manufactured silks, straw-hats and straw-plaiting, oil, fruits, borax, cheese, anchovies, marble, sulphur, and coral. Its imports comprise colonial produce, raw and manufactured cotton, and wool, cutlery, hardware, metallic goods, earthenware, and salted fish.

Towards the end of the 13th c. Leghorn was an unprotected village, which only assumed some importance on the destruction of the port of Pisa, and especially on its being assigned to Florence in 1421. Alessandro dei Medici constructed its citadel and fortified the town; Cosmo I. declared it a free port, and from that time dates the rise of its prosperity. In the 17th c., under Ferdinand I., it was a town of great commercial importance; and during the French imperial occupation of Italy, Leghorn was proclaimed the chief town of the department of the Mediterranean. In the Italian revolutions succeeding 1830, Leghorn took a foremost part.

LEGION, in the Roman military system, corresponded in force and organization to what in modern times we should call a *corps d'armée*. It differed in constitution at different periods of Roman history. In the time of the republic, a legion comprised 4,500 men, thus divided: 1200 *hastati*, or inexperienced troops; 1200 *principes*, or well-trained soldiers; 1200 *velites*, or skirmishers; 600 *triarii*, or *pilani*, veterans forming a reserve; and 300 *equites*, knights who acted as cavalry, and belonged to families of rank. During this period the legions were formed only for the season, standing armies being of later growth.

The *hastati*, *principes*, and *triarii* formed three separate lines, each divided into 10 *maniples* or companies, of 120 men each in the case of the two front lines, and of 60 men in the *triarii*. A *maniple* was commanded by a centurion or captain, who had a second-centurion, or lieut., and two sub-officers, or sergeants, under him: as non-commissioned officers, there was a *decanus*, or corporal, to every squad or tent of 10 men. The senior centurion of each line commanded that line, and had therefore functions corresponding to a modern lieut.col. The *primipilus*, or senior centurion of the *triarii*, was the most important regimental officer, and commanded the legion in the absence of the tribunes. The 300 cavalry formed a regiment of 10 *turmæ*, or troops of 30 horsemen, each under 3 *decurions*, of whom the senior had the command. The *velites* were light troops, not forming part of the line of battle; had apparently no officers of their own; and were attached to the 30 *maniples* in equal proportions. The staff of the legion consisted of 6 tribunes, who managed the paying, quartering, provisioning, etc., of the troops, and who commanded the legion in turns for a period each of 2 months. This changing command, although inconvenient, lasted till the times of the civil wars, when a *legatus*, or lieut.gen., was appointed as permanent commandant of the legion.

The offensive weapons of the *hastati* and *principes* were two barbed iron-headed javelins, one of which was hurled at the enemy on the first onslaught, while the other was retained as a defense against cavalry. The *triarii* had long pikes. In addition to these arms, every soldier bore a short, strong, cut-and-thrust, two-edged sword. The legionaries' defensive armor consisted of plumed helmet, breast-plate, iron-bound boot for the right leg, and a semi-cylindrical shield 4 ft. long by 2 $\frac{1}{2}$ broad. The *velites* had no defensive armor, were lightly armed, and in action usually operated for flanking purposes. Each *maniple* bore an ensign aloft, and each legion had its distinguishing eagle. Up to the time of Marius, service in a legion was sought as honorable occupation, and men of some means were alone eligible; but Marius enlisted slaves, and turned the legions into corps of a purely mercenary army. At the same period, the manipular formation was abolished, the 3 lines were assimilated, and the legion was divided into 10 cohorts, each of 3 *maniples*. Soon the cohorts were raised to 600 men, making the

legion 6,000 infantry besides cavalry and velites. It was ranged in 2 lines of 5 cohorts each; but Cæsar altered the formation to 3 lines, of respectively 4, 3, and 3 cohorts.

During the later empire, the legion became complex and unmanageable; many sorts of arms being thrown together, and balistæ, catapults, and onagers added by way of artillery. Having so degenerated from its pristine simplicity and completeness, the legionary formation was soon overthrown amid the incursions of the victorious barbarians.

LEGION OF HONOR, an order of merit instituted under the French republic in 1802 by the first consul, as a recompense for military and civil services. It was ostensibly founded for the protection of republican principles and the laws of equality, and for the abolition of differences of rank in society, every social grade being equally eligible; but its real aim doubtless was, by popularizing the idea of personal distinction, to pave the way for the establishment of the empire and of the more exclusive titles of nobility that were to accompany it. The proposal for its institution was at first violently opposed by the legislative body and the tribunate, on democratic grounds, and carried eventually by a narrow majority.

The order originally comprised three classes—grand officers, commanders, and legionaries. The class of grand officers was, on the coronation of Napoleon I., divided into knights of the grand eagle (the highest class), and grand officers. On the restoration of the Bourbons, the legion was retained, but remodeled so as to lose much of its original character. The eagle was called a cross, and the effigy of Henry IV. replaced that of Napoleon. The knights of the grand eagle became grand crosses, the legionaries were transformed into knights, and the numerous educational institutions, founded by Napoleon for the children and relatives of the members of the order, were much reduced in scale. In 1837 a new military class called officers was admitted. Under the presidency of Louis Napoleon, part of the property of Louis Philippe, which had been restored to the state, was set apart as an endowment for the legion, and new regulations were made regarding the pensions of the different classes. The original form of decoration was reintroduced, which under the second empire was somewhat modified. As worn then, it consisted of a cross of ten points of white enamel edged with gold, the points connected with a wreath of laurel proper, and in the center, with an azure circle charged with the words "Napoléon III., Empereur des Français," was a head of the emperor. The cross is ensigned by the imperial crown of France, and worn attached to a red ribbon. The grand officers also wore on the right breast a silver star charged with the imperial eagle. The same star was worn on the left breast by the knights grand cross, and their cross was attached to a broad red ribbon which passes over the right shoulder.

The vast numbers of this order, and the insignificance of many of the persons on whom it has been conferred, have detracted much from its value. The number of members in 1872 was 69,179; but the law passed in that year, that only one new member should be added for every two vacancies, reduced the membership in the next five years (1877) to 59,208. The revenue of the college of the legion has been augmented by the addition of property belonging to Louis Philippe. Out of this fund pensions are paid to those members of the order who have served in the army or navy; the civilian members receive no pension. These pensions amounted in 1877 to the sum of £454 554. By the existing statutes, candidates in time of peace must have served in some military or civil capacity for 20 years; exploits in the field or severe wounds constitute a claim in time of war. Two distributions take place in the year. The nomination of military persons takes place on parade, and of civil in the courts of justice. No ignoble punishment can be inflicted on a member of the order so long as he belongs to it. To rise to a superior rank, it is indispensable, at least for natives of France, to have passed through the inferior grades.

LEGION, THEBAN, according to tradition, a number of Christians, who, about A.D. 286, submitted to martyrdom rather than attack their brethren or sacrifice to the gods. This occurred during the persecutions by the emperor Maximin. Maurice, the leader of the league, was canonized.

LEGION, THE THUNDERING (Lat. *Legio Fulminatrix*), a legion of the Roman army which is the subject of a well-known miraculous legend. During Marcus Aurelius's war with the Marcomanni (174 A.D.), his army, according to this narrative, being shut up in a mountainous defile, was reduced to great straits by want of water; when, a body of Christian soldiers having prayed to the God of the Christians, not only was rain sent seasonably to relieve their thirst, but this rain was turned upon the enemy in the shape of a fearful thunder-shower, under cover of which the Romans attacked and utterly routed them. The legion to which these soldiers belonged was thence, according to one of the narrators, called the Thundering Legion. This legend has been the subject of much controversy; and it is certain that the last told circumstance at least is false, as the name "thundering legion" existed long before the date of this story. There would appear, nevertheless, to have been some foundation for the story, however it may have been embellished by the pious zeal of the Christians. The scene is represented on the column of Antoninus. The event is recorded by the pagan historian Dion Cassius (lxxi. 8), who attributes it to Egyptian sorcerers; and by Capitolinus and Themistius.

the latter of whom ascribes it to the prayers of Aurelius himself. It is appealed to by the nearly contemporary Tertullian, in his *Apology* (c. 5), and is circumstantially related by Eusebius, by Jerome, and Orosius. It may not improbably be conjectured, supposing the substantial truth of the narrative, that the fact of one of the legions being called by the name "thundering" may have led to the localizing of the story, and that it may have, in consequence, been ascribed to this particular legion, which was supposed to have received its name from the circumstance.

LEGITIM, or BAIRN'S PART, in the Scotch law, is the legal provision which a child is entitled to out of the movable or personal estate of the deceased father. In Scotland a father is not allowed to disinherit his children to a certain extent, the extent varying according as the wife survives or not. If a wife survive, and also children survive, the movable estate is divided into three equal parts. One is the widow's *jus relictæ* (q.v.), another is the children's legitim, the other third is the dead's part (q.v.), which the father may bequeath by will if he pleases, but if he make no will, then it goes to the children as next of kin. If the wife is dead, then half is legitim, and the other half is dead's part. Moreover, a father, though in his lifetime he may, without any check from his children, squander his property, still is not allowed on his death-bed to make gifts so as to lessen the fund which will supply legitim. The children's claim to legitim may be qualified by an antenuptial contract of marriage, which provides some other provision to the children in lieu of legitim; but, as a general rule, the children's claim cannot be defeated by anything the father can do by means of a will or what is equivalent to a will. The legitim is claimable by all the children who survive the father, but not by the issue of those children who have predeceased. It is immaterial what the age of the child may be, and whether married or not. Children claiming legitim must, however, give credit for any provision or advance made by the father out of his movable estate in his lifetime. All the children, though of different marriages, share in the legitim. In England and Ireland there is no similar right to legitim, for the father can bequeath all his property to strangers if he please; but a similar custom once existed in the city of London, and York, now abolished by 19 and 20 Vict. c. 94.

LEGIT'IMACY, PETITION TO DECLARE. In Scotland it has always been competent for a party who wished to establish that he was a legitimate person, to raise an action of declarator of legitimacy, when the court solemnly decided the question. In England this could not be done, except indirectly in the course of some suit for another purpose, until 1858, when the statute 21 and 22 Vict. c. 93 allowed all natural-born subjects whose legitimacy was doubted to present a petition to the divorce court to have the question decided. A similar act for Ireland was passed in 1868 (31 and 32 Vict. c. 20).

LEGITIMA'TION, in Scotch (and foreign) law, is the rendering legitimate a person who was born illegitimate. This is done by the father subsequently marrying the mother of the child, and hence it is often called legitimation *per subsequens matrimonium*. This effect, however, can only be produced provided at the time of the birth the parents might have been married, or there was no obstacle to their then marrying, if so inclined, as, for example, if they were both unmarried, and there was no impediment. Sometimes it has happened that the father, A, or mother, B, after the child's birth, marries a third person, and has children, and after the dissolution of the marriage, A and B then marry. In this perplexing case the courts have held that the intervening marriage with a third party does not prevent the bastard child, born before that event, from being legitimated by the subsequent marriage of A and B. But it has not been settled what are the mutual rights of the children of the two marriages in such circumstances, though it appears that the legitimate-born children cannot be displaced by the legitimated bastard. The doctrine of legitimation *per subsequens matrimonium* is not recognized in England or Ireland, having been solemnly repudiated by the famous statute of Merton, and the maxim prevails there, "once a bastard, always a bastard." Legitimation is also recognized in Scotland, but not in England or Ireland, where the parents were not really married, though they both *bonâ-fide* believed themselves to be married. This is called a putative marriage. The Scotch law on these subjects follows the canon law, and the French law is the same.

LEGNA'GO, a fortified t. of northern Italy, in the province of Verona, on the left bank of the Adige, 22 m. s.s.e. from Verona. It has manufactures of hats and leather, and a considerable trade in wheat and rice. The country is swampy, and intermittent fevers prevail. Legnago is one of the fortresses in the famous quadrilateral (q.v.). Pop. 3,514.

LEGOUVÉ, GABRIEL ERNEST WILFRID, b. Paris, 1807; son of Gabriel Marie; adopted the profession of his father, and wrote miscellaneously, but chiefly for the stage. His most important work, *Adrienne Lecourteur*, was written in association with Scribe and played by Rachel. He also composed a version of the story of Medea, in which the great tragedienne refused to perform, being heavily fined by her manager in consequence. Legouvé became a member of the academy in 1856.

LEGOUVÉ, GABRIEL MARIE JEAN BAPTISTE, 1764–1812; b. Paris; was a poet of ability and erudition, wealthy by inheritance, who devoted his life to literature. He wrote several tragedies, which met with success, and one of these, *Epicharis et Néron*,

was dignified by the performance of the great actor Talma in the character of the tyrant. His *Henri IV* and *La Mort d'Abel* were highly esteemed, and he wrote also several poems of merit. He was a member of the institute, and professor of Latin poetry. The latter part of his life was rendered unhappy by domestic affliction and other troubles, and in 1810 he became deranged and was placed in a private asylum, where he died.

LEGRAND DU SAULLE, HENRI, a French physician; b. in Dijon, 1830; of high authority on the treatment of the insane. His work, *Dé Folie Devant les Tribunaux*, was awarded an academical prize. His essay on *Le Délire des Persécutions*, suggested by the rancor of retaliation against the commune, attracted general attention.

LEGS, HUMAN, are not unfrequently borne as charges in heraldry, sometimes naked, sometimes booted, and they may be coupled, i.e., cut evenly off, or erased, cut with a jagged edge, and that either at the thigh or below the knee. The knee when represented is always embowed. A remarkable device of three legs in armor, conjoined at the thighs, and flexed in triangle, forms the insignia of the ancient kingdom of Man, with the appropriate motto, *Quocunque jeceris stabit*. "The classical symbol of the island of Sicily (Trinacria) was formed of three naked legs similarly conjoined, and the triple-mounted Isle of Man might have awakened in its Norman sovereigns some recollections of their Mediterranean conquests."—*Planché*.

LEGUME, *Legumen*, in botany, a fruit consisting of a single carpel, two-valved, and with the seeds—one or many—attached to the ventral suture only. It is commonly called a *pod*, and occurs in most of the species of the great natural order *leguminosæ* (q.v.), of which the bean and pea are familiar examples. The legume generally opens when ripe, and then both by the dorsal and ventral suture; whereas the *follicle*, which nearly resembles it, opens by a suture along its face, and is one-valved. A few legumes do not open, but the sutures are present. Some are divided by transverse *partitiens* (*diaphragms*); and the kind called a *lomentum* is contracted in the spaces between the seeds, and separates into pieces instead of opening.

LEGUMINE, or VEGETABLE CASEINE. The seeds of most leguminous plants (peas, beans, lentils, etc.), and of the sweet and bitter almond, contain a protein or albuminous body, which in all its essential properties corresponds with the caseine of milk. For example, it is precipitated from its solutions by rennet, acetic acid, alcohol, etc., and is not coagulated by boiling; while, as in the case of milk, the application of heat occasions the formation of a pellicle on the surface. The affinity of the two kinds of caseine is further shown by the fact that cheese is made by the Chinese from peas and beans.

In order to obtain legume, peas, beans, or lentils are well soaked in hot water, and after being reduced to a pulp, are mixed with a considerable quantity of water. The starch, membranes, etc., soon sink to the bottom, and the legumine must be precipitated by acetic acid from the decanted or filtered fluid. Dry peas contain about one-fourth of their weight of legumine.

LEGUMINO'SÆ (*fabaceæ* of Lindley), a great natural order of exogenous plants, containing herbaceous plants, shrubs, and trees, many of them of the greatest magnitude. The leaves are alternate, usually compound, and have two stipules at the base of the leaf-stalk, which often soon fall off. The inflorescence is various. The calyx is inferior, 5-parted, toothed or cleft, the segments often unequal. The petals are 5, or, by abortion, fewer, inserted into the base of the calyx, usually unequal, often *papilionaceous* (q.v.). The stamens are few or many, distinct or variously united. The ovary is 1-celled, generally of a single carpel; the style simple, proceeding from the upper margin, the stigma simple. The fruit is either a legume (q.v.) or a drupe (q.v.). The seeds are solitary or numerous, occasionally with an aril, often curved; the cotyledons very large.—There are three sub-orders: 1. *Papilionaceæ*, with papilionaceous flowers; 2. *Cæsalpineæ*, with irregular flowers and spreading petals; 3. *Mimosæ*, with small regular flowers.—This natural order contains almost 7,000 known species, of which about 5,000 belong to the sub-order *papilionaceæ*. They are spread over all parts of the world, from the equator to the poles, but their number is greatest in tropical and sub-tropical regions. They are applied to a great variety of purposes, and some of them are of great importance in domestic economy, the arts, medicine, etc. To this order belong the bean, pea, kidney-bean, and all kinds of *pulse*; clover, liquorice, broom, laburnum, lupine, senna, and many other medicinal plants; tamarind, logwood, indigo, and many others which afford dyes, etc.; the *acacias*, *mimosas*, etc. Many species are interesting on account of their beauty of form, foliage, or flowers. In the seeds of many is found a nitrogenous substance called *legumine* (q.v.) or *vegetable caseine*.

LEH. See LE LEH, *ante*.

LEHIGH, a co. in s. Pennsylvania, having the Lehigh river for its n. and n.e. boundary; drained also by Jordan creek, running south-eastward, and emptying into the Lehigh river at Allentown; 341 sq.m.; pop. '80, 66,220. Its surface is diversified and has features of great natural beauty, with comparatively little woodland. Its n.w. border is defined by the Kittatinny, or Blue, mountain and valley, the latter remarkable for its beauty and fertility. In the extreme s.e. is South mountain. It contains Delaware

Water Gap in the extreme northern portion, a celebrated resort for tourists, where the Delaware river passes through a narrow gorge in the Blue mountains, 3 miles in length, whose sides rise 1400 ft. above the water, and whose rocks are composed of Silurian limestone, Medina sandstone, and slate. It contains zinc and iron mines, and extensive iron works, furnaces, rolling mills, and iron foundries. Value of pig iron in 1870, \$6,194,970. It had, in 1870, 23 iron mines, employing 383 hands (140 underground), with a capital of \$223,447, and annual product of \$384,168. It had 12 stone quarries, employing 95 hands, with a capital of \$28,700 and annual product \$59,995. Its leading industries are the manufacture of carriages, bricks, clothing, leather, tin, copper, and sheet-iron ware. Among its manufactories are breweries, tanneries, refined petroleum and currying establishments, saw and flour mills. It had, in 1870, 694 manufacturing establishments, employing 5,345 hands, with a capital of \$10,276,247, and an annual product of \$15,480,848. Its soil is fertile and produces fruit, wheat, and all kinds of grain. Cash value of farms in 1870, numbering 3,045, \$23,555,476. Value of all live stock in 1870, \$1,949,157. It is intersected by the Lehigh Valley railroad, the Lehigh and Susquehanna, the East Pennsylvania branch of the Philadelphia and Reading railroad, and the North Pennsylvania railroad. Seat of justice, Allentown.

LEHIGH RIVER, in e. Pennsylvania, rising in the s.w. extremity of Pike co., flows s.w. to the Blue ridge, 12 m. below Mauch Chunk, passing through a gorge of the Kittatinny mountain, then s.e. to Easton, uniting at that point with the Delaware. It is nearly 120 m. in length, and by skillful engineering it has been made to float steamboats from Whitehaven, 84 m. from its mouth. It is a swiftly flowing stream passing through a rich anthracite coal, iron, and lumber region, winding among sterile mountain ranges, through narrow ravines, and over level, fertile plains. Its course is parallel with the railroad of the Lehigh coal and navigation company from Mauch Chunk to Easton.

LEHIGH UNIVERSITY, in South Bethlehem, Northampton co., Penn., was founded in 1865 through the liberality of Asa Packer, who gave 56 acres of land as a site and endowed it with the sum of \$500,000. It is a Protestant Episcopal institution. Number of professors in 1878, 14; students, 113. President, John M. Leavitt, D.D.

LEHMANN, CHARLES ERNEST RODOLPHE HENRI, b. at Kiel, in Holstein, 1814; received his first instruction in painting from his father, but afterwards went to Paris, where he was the pupil of Ingres, and began to exhibit in 1835. His pictures are remarkable for brilliancy of color, and for a certain poetic quality which appeals strongly to the imagination. The Bible and Greek literature have afforded him his best subjects. He has also painted some excellent portraits of eminent men.

LEIA, an important trading t. of India, in the Punjab, is situated in a fertile district on the left bank of the Indus, 60 m. s. of Dera Ismael Khan. Lat. 31° n., long. 71° e. Besides being a mart for the sale of the produce of the surrounding district, it carries on an extensive transit-trade between the Punjab and the regions w. of the Indus. Provisions, metals, grain, and cotton and wool are the chief articles of sale. Pop. '68, 17,033.

LEIBNITZ (more accurately LEIBNIZ), **GOTTFRIED WILHELM VON**, perhaps the most extraordinary example of universal scholarship upon record, was b. July 6, 1646, at Leipsic, where his father was professor of law. He studied at the "Nicholas school" of his native city, under Thomasius; but he derived much more of the vast store of miscellaneous learning which his after-life exhibits from his private studies in a library to which he had access, and thus entered the university with peculiar advantages in his 15th year, selecting the law as his profession, but devoting himself also to philosophy and literature. He spent some time at the university of Jena, and on his return presented himself for the degree in law, for which he composed two essays of very remarkable merit. In consequence of his youth, however, he was refused the degree at Leipsic, and ultimately (in his 20th year), in 1666, graduated at Altdorf, where he was offered, but declined, a professorship; accepting in preference the post of secretary and tutor in the family of the baron von Boineburg, to whom he rendered, from 1667 till 1672, a variety of literary and politico-literary services, and through whose recommendation he was appointed member of the judicial council in the service of the archbishop-elector of Mainz. In 1672 he accompanied Boineburg's sons to Paris, and there submitted to Louis XIV. an essay entitled *Consilium Aegyptiacum*, containing a plan for the invasion of Egypt, which is by some supposed to have led to the Egyptian expedition of Bonaparte in 1798. In the course of this tour, which extended also to London, he formed the acquaintance of the most eminent philosophers of France and England, and among them of Newton. On the death of the elector of Mainz, Leibnitz, declining an appointment at Paris which would have necessitated his becoming a Catholic, entered the service of the duke of Brunswick, and followed that prince, in 1676, as privy-councilor and librarian, to Hanover, where he permanently fixed his residence. His literary services to this court were of a very miscellaneous character. After a tour of historical exploration he prepared a series of works illustrating the history of the house of Brunswick, seven volumes of which were published by himself, and two have been edited in our own time by Dr. Perz, *Annales Imperii Occidentis Brunsvicensis* (1843-45). He undertook likewise the scientific direction and organization of the royal mines, into which he intro-

duced many improvements; and he also, at the desire of the prince, took an active part in the negotiation for church union, and the theological discussions connected therewith, which formed the subject of a protracted correspondence with the celebrated Bossuet (q.v.) and with M. Petisson, and led to the preparation, on his own part, of a very curious exposition of doctrinal belief (published from his MS. within this century, under the title *Systema Theologicum*), which, although written in the assumed character of a Catholic, was intended to form a basis of negotiation. His private studies, however, were chiefly philosophical and philological. His correspondence on these subjects was most extensive, and he contributed largely to almost every literary and scientific journal of his day. He was the chief organizer of the academy of Berlin, of which he was the first president, and originated both at Dresden and Vienna a project for the establishment of similar bodies. It was to him, likewise, that Peter the great, who invited him to a meeting at Torgau, and bestowed on him a pension of 1000 rubles, with the title of privy-councilor, owed the plan of the since celebrated academy of St. Petersburg. On the accession of the elector George to the crown of Great Britain, as George I., Leibnitz was disappointed in his expectation of accompanying the prince to his new court; nor did he long survive that event. His death, which was rather unexpected, occurred at Hanover, Nov. 14, 1716. His biographers justly complain that his memory was treated with but little honor by his contemporaries; but a tardy atonement for their neglect has been recently offered by the erection of a monument in one of the squares of the city of Hanover. The scholarship of Leibnitz, as regards the vastness of its range, is probably unexampled. He was eminent in languages, history, divinity, philosophy, political studies, experimental science, mechanical science, and even belles-lettres. But it is chiefly through his philosophical reputation that he lives in history. It would be difficult to convey, in a popular sketch, a correct notion of his philosophical system, especially as he has nowhere himself methodized it. He was deeply influenced by the Cartesian philosophy, but he differed from Descartes both in his method and in some of his principles. The most important peculiarities of Leibnitz's system may be reduced to four: his doctrine as to the origin of ideas, his theory of monads (q.v.), the "pre-established harmony," and the theory of optimism (q.v.). Of these, three will be found discussed under separate heads. The pre-established harmony requires a few words of explanation. The object of this singular conception was to explain the mysterious problem of the joint action of mind and body, or even in general the joint action of any two or more of the so-called "monads," since Leibnitz held that no two "monads" could act upon each other. Descartes had resolved this problem by his theory of assistance, which attributed all action to the direct assistance of God. Leibnitz, rejecting this hypothesis, supposed the mind and the body to be two distinct and independent machines, each having its own independent though simultaneous action; but both so regulated by a harmony pre-established by God, that their mutual actions shall correspond with each other, and shall occur in exact and infallible unison. This harmony Leibnitz explained by the example of two time-pieces, one of which should be made to strike just as the other pointed to the hour. In the same way, just at the moment when the mind freely determines itself to a particular act, the body, by a harmony pre-arranged by God, will produce the particular action which is required to give efficacy to the volition of the mind. One of the most painful incidents in the literary and scientific history of Leibnitz was his controversy with Newton as to priority in the discovery of the method of the calculus. See CALCULUS, FLUXIONS. Leibnitz was the inventor of a calculating-machine, the working-model of which is still preserved at Göttingen. His works were first collected by Dutens, in 6 vols. 4to, Geneva; his philosophical works by Raspe, Amsterdam, 1767; and his letters at Lausanne and Geneva, 2 vols. 4to, 1745. Other collective editions are those of Pertz (1843-62), Foucher de Careil (begun in 1859), and Klopp (begun in 1864). The best edition of Leibnitz's philosophical works is Erdmann's (1840); and the best life of Leibnitz is by Guhrauer, *Leibnitz, Eine Biographie*, 2 vols. 8vo (Breslau, 1842).

LEIBNITZ, GOTTFRIED WILHELM VON (*ante*), not only one of the most remarkable examples of universal scholarship, but also of early acquirement, excelling in precocity the prodigy Chatterton; for, although he did not reach maturity as soon as Chatterton, he excelled him in mental power and acquirements at an early age. At a period when the latter was merely a brilliant writer, Leibnitz was a philosopher and had solid acquirements. Before he was 12 years old he was quite familiar with many Latin authors, and was also making critical readings of Bacon and Descartes as compared to Aristotle and Plato, and was forming theories which embraced the idea of the unity of all the sciences. His treatise *De Principio Individuē*, which was produced on becoming bachelor of philosophy at the age of 17, is the most wonderful example of early erudition and power of thought on record. The refusal of the faculty at Leipsic to grant him the degree of doctor of law was, according to some, only ostensibly on account of his youth, really because of ill-will entertained towards him, and which caused him to leave his native city forever. Previous to meeting the baron von Boineberg he became acquainted with a society of Rosicrucians and alchemists at Nuremberg, and as their secretary recorded their experiments and searched the alchemic authors for evidences of the philosopher's stone. It would require a large volume to contain brief notices, not

to speak of commentaries, on all his works. His visit to Paris in company with the sons of Boineburg resulted in his acquaintance with Huygens and Cassini—the one the greatest continental physicist, and both the most accomplished practical astronomers of that time. He also visited Newton in England, and must have obtained from these sources many ideas which aided him in forming his system of the calculus. At Paris, especially, he devoted himself to mathematics and physics. He was an especial friend and admirer, and indeed pupil, of Huygens, although the latter did not follow the methods of the calculus until his old age because of his wonderful facility in the older methods. The genius of Leibnitz must have been colossal, but his domain was too vast to admit of undisputed sway, and some of his doctrines require the support of reasoning which is not sufficiently grounded in established truths. There is a certain degree of unwarrantable assumption and hypothesis involved in the doctrine of monads, and his doctrine of pre-established harmony, as briefly noticed in the foregoing article, is not as well grounded in logical data as many more recent works on metaphysical or philosophical subjects, although exhibiting wonderful talent in giving verbal form to brilliant ideas. Many of his ideas had been formed in his youth, and notwithstanding his immense intellectual ability, they must have been in some degree, it may be justly said, crude; for if modern biological science has demonstrated anything, it is the fact that a certain length of time—more than 25 years—is required to allow of the development of any brain as an efficient organ of extensive thought; and this remark is justified by the fact that his doctrine of monads, of pre-established harmony, and of optimism, have resulted in no positive advancement in mental or physical science. The doctrine of monads, besides being inconsistent with the tenor of much else that he wrote, may indeed be taken as one of the foundations of materialism; at least, some of the hypotheses contained in it may be so used. If his hypothesis that to arrive at the essential power of matter (and he concedes that it possesses inherent power) we must proceed to its ultimate elements, be well founded, then the doctrine of evolution is easily maintained—a doctrine which, although not demonstrably inconsistent with that of optimism, or of pre-established harmony, is opposed to ideas assumed in many other portions of his writings. For instance, at the congress of Nimeugen, in 1677, he produced a treatise in which he defined theology as the jurisprudence of God, and maintained, although not a Roman Catholic, that all the states of Christendom should form but a single body, with the pope for its spiritual and the emperor for its temporal head. To uphold many of his philosophical ideas he maintained that logical truth is equivalent to actual truth, and that ideas are identical with things; and this is a logical deduction from the premises that an ultimate particle, or rather its attenuation, like a monad, possesses the power of thought. From this also naturally flows the idea that any abstract conception which involves no contradiction with reason must be absolutely true. The doctrine of monads is essentially a mystical one, and may be taken as the nidus for the evolution of many hypotheses or theories. If, as Leibnitz maintained, monads be the simple, active elements of things, the veritable living atoms of nature, the final forces of the universe, uninfluenced from without, but continually changing by an inward principle in consequence of which they develop themselves spontaneously, and if they be, properly speaking, souls, each independent of the other, and also a microcosm of the whole universe, we have elements out of which may be formed various evolution hypotheses, preordained harmonies, or simple pantheism. God, he says, is the original monad, from which all the rest are generated. To maintain some of his positions he considers that there are two kinds of monads, conscious and unconscious, and that God has so perfected all things that all the monads in the universe work together to accomplish that for which they were intended. This harmony results from the nature of monads, as well as from a pre-established divine decree. A harmony therefore follows between all parts of matter, between the future and the past, and between divine decrees and human actions; and one physical cause follows another in preordained sequence. The doctrine of optimism naturally follows from these conclusions.

LEICESTER, a t. of England, municipal and parliamentary borough, and capital of the county of the same name, is situated on the right bank of the Soar, about 100 m. n.n.w. of London. It contains numerous interesting churches, one of which, St. Nicholas, is partly built of bricks from an ancient Roman building in the vicinity. Besides the ecclesiastical edifices, there are a number of important educational and benevolent institutions. Manufactures of boots and shoes, and of woolen and hosiery goods, lace-making, wool-combing and dyeing, are extensively carried on. Leicester is the center of a famous agricultural and wool-raising district. There are about 12 fairs annually, The town of Leicester returns 2 members to Parliament. Pop. '71, 95,084.

Leicester, known to the Romans as *Ratae*, derives its present name either from Leirc, the former name of the Soar, or from its having been a *civitas legionum*, a station or camp (*castra*) of the legions, which the Saxons would translate into Legeo-ceaster, corresponding to the British or Welsh Caer-leon. Under the Lancastrian princes, its castle, now almost entirely destroyed, was frequently a royal residence. The ruins of the abbey of St. Mary Pré, or De Pratis, where cardinal Wolsey died, still exist.

LEICESTER, ROBERT DUDLEY, Earl of, b. 1531, was the son of John Dudley, duke of Northumberland. His father was executed on account of the part which he took in the cause of lady Jane Grey, and he was himself imprisoned on the same account. He was liberated in 1554; and in 1558, on the accession of Elizabeth, the dawn of his fortune began. He was made master of the horse, knight of the garter, a privy-councilor, high steward of the university of Cambridge, baron Dudley, and earl of Leicester. For these high honors he seems to have been indebted solely to a handsome person and a courtly manner, for the course of his life shows him to have been possessed of not one single quality either of head or heart deserving of admiration. When young, he married Amy, daughter of sir John Robsart. The general voice of the times has charged him with being accessory to her murder; and it is certain that she died suddenly, and very opportunely for his ambitious views, he being at that time a suitor for the hand of Elizabeth. Elizabeth gave out that she wished him to marry Mary of Scotland; but in this the English queen was acting with her usual insincerity. She encouraged Leicester openly as a suitor long after his arrogance had disgusted the nobles, and his profligacy had brought him into disrepute with the nation. His marriage to lady Essex for a time excited the anger of his royal mistress, but she soon forgave him. In 1585 he went into the Low Countries at the head of a military force; but on this, as on two subsequent occasions, he showed himself utterly unfitted for command. He died suddenly on Sept. 4, 1588. It was commonly said that he was poisoned by his wife, she having given him a potion which he had intended for her.

LEICESTER, SIMON DE MONTFORT, Earl of. See MONTFORT, SIMON DE, *ante*.

LEICESTERSHIRE, an inland co. of England, lies immediately s. of the counties of Derby and Nottingham. Area, 511,719 acres; pop. '71, 269,311. The surface of the county is covered throughout by low hills. The district in the s.w., still called "Charnwood Forest," retains its name, although it is now almost destitute of wood. The "Forest" is occupied by hills, which, though inconsiderable in height, are rugged, distinct, and individual in outline. From the highest of them, Bardon hill, 853 ft. in height, an extensive view is obtained. The climate is mild, and the soil, which varies in fertility, is chiefly loamy. The richest tracts are kept in pasture, for which this county is famous. In 1875 the acreage under corn crops was 111,170; green crops, 26,456; and permanent pasture, 293,626. Grazing, and sheep and cattle breeding, are carried on with great skill and success. An improved long-horn is the favorite breed of cattle. In 1875 there were in the county 17,426 horses, 136,848 cattle, 453,477 sheep, and 25,685 pigs. The "Stilton" variety of cheese is for the most part made in this county. Coal-mines are worked, and granite, slate, and freestone quarried. The county returns 4 members to parliament.

LEICHHARDT, LUDWIG, 1813-48; b. at Trebitsch, in the Prussian province of Brandenburg; studied philology, medicine, and natural science at Göttingen and Berlin; traveled in Italy, France, and England, and in 1841 went to Australia, where he won great distinction as an explorer. His *Journal of an Overland Expedition in Australia from Moreton Bay to Port Essington* was published in 1847. At the close of that year he started to go across the Australian continent from e. to w., but died on the way. His life, by Zuchold, appeared in 1856.

LEIDY, JOSEPH, b. Philadelphia, 1823; graduated from the medical department of the university of Pennsylvania in 1844, and thenceforward devoted himself to biological studies, especially comparative anatomy and vertebrate paleontology, on which he published valuable papers in the *Proceedings* of the academy of natural sciences in Philadelphia, in the *Transactions* of the American philosophical society, and in the *Contributions to Knowledge* of the Smithsonian institution. In 1853 he was appointed professor of anatomy in the university of Pennsylvania, and in 1871 professor of natural history in Swarthmore college. During the war of the rebellion he served with distinction as surgeon of Satterlee hospital in Philadelphia. Among his works are: *Flora and Fauna within Living Animals*; *Memoir on an Extinct Species of American Ox*; *Ancient Fauna of Nebraska*; *Memoir of the Extinct Sloth Tribe of North America*; *Cretaceous Reptiles of the United States*; and *Contributions to the Extinct Vertebrate Fauna of the Western Territories*.

LEIGH, a rapidly increasing poor-law union in Lancashire, England, a station on the Bolton and Liverpool railway, is situated 13 m. w. of Manchester. Silks, cambrics, muslins, and fustians are extensively manufactured; cotton-spinning and weaving are carried on; there is a large foundry, where agricultural implements are extensively made; and in the vicinity are productive coal-mines and flour-mills. Pop. in '71, 10,621; in '71, 33,592.

LEIGH, BENJAMIN WATKINS, LL.D., 1781-1849; b. in Chesterfield co., Va.; graduated at William and Mary college; entered the legal profession, practicing successively at Petersburg and Richmond, and served as reporter of the court of appeals. He was frequently chosen to the legislature, and served as commissioner to revise the statutes of the state, and also to adjust questions in dispute with Kentucky. In 1835 he was elected to the U. S. senate, where he took a prominent position, but resigned in 1837. He published 12 vols. of reports of the court of appeals and general court of Virginia.

LEIGH, EDWARD, 1602-71; b. England; educated at Oxford and studied law in the middle temple. In 1636 he entered parliament, became a col. in the parliamentary army during the civil war, and soon afterwards a member of the Westminster assembly of divines. In 1648 he was turned out of parliament for favoring a reconciliation with the king. During the remainder of his life he was engaged in the study of theology, and published the following works: *A Body of Divinity*, London, 1654; *Annotations on the Five Poetical Books of the Old Testament*, London, 1657; *Annotations upon all the New Testament*, London, 1650; *A Treatise of the Divine Promises*, London, 1653; *Critica Sacra*, London, 1662; *A Treatise of Religion and Learning and of Religious and Learned Men*, London, 1656.

LEIGHTON, ALEXANDER, 1568-1644; b. Edinburgh, Scotland; educated in the university there, and was professor therein of moral philosophy from 1603 to 1613, when he became a Presbyterian preacher in London, practicing medicine at the same time. He published *Speculum Belli Sacra, or The Looking-Glass of the Holy War*; and an *Appeal to the Parliament, or Sion's Plea against the Prelacie*. The latter was deemed libelous in respect of the king, queen, and bishops, and he was twice sentenced by the star-chamber to be publicly whipped, to lose both ears, to stand twice in the pillory, to be branded on the cheek with the letters S. S. (sower of sedition), to pay a fine of £10,000, and suffer perpetual imprisonment in the fleet. The Long parliament released him in 1640, after he had been confined for 11 years. He was awarded a pecuniary indemnity, and in 1642 was made keeper of Lambeth palace as a state prison, where he died.

LEIGHTON, FREDERICK, b. at Scarborough, England, 1830; learned drawing in Rome, entered the royal academy at Berlin as a student in 1843, finished his education at Frankfort and went to Brussels, where, in 1848, he produced his first painting, "Cimabue Finding Giotto Drawing in the Fields." After studying further at Paris and Frankfort he went again to Rome, where he reproduced the "Cimabue" for exhibition at the London royal academy in 1855. The picture was so successful as to be purchased by the queen. He has gained great distinction in his art, and among his works are: "Triumphs of Music;" "Scene from Romeo and Juliet;" "Star of Bethlehem," "Michael Angelo Nursing his Dying Servant;" "Helen of Troy;" "David;" "Syracusian Bride Leading Wild Beasts to the Temple of Diana."

LEIGHTON, ROBERT, Archbishop of Glasgow, was b. in Edinburgh, or, as others think, in London, in the year 1611. He entered the university of the former city in 1627, took his degree of M.A. in 1631, and afterwards proceeded to France. Here he resided with some relatives at Douay, and formed the acquaintance of several Roman Catholic students, whose Christian virtues confirmed the natural charity of his spirit. Leighton, indeed, could never have been a bigot. Gentle, tender, and pious from his earliest years, he shrank from all violence and intolerance; but his intercourse with men whose opinions were so different from his own, convinced his reason of the folly and sinfulness of "thinking too rigidly of doctrine." Returning to Scotland, he was appointed, in 1641, to the parish of Newbattle, near Edinburgh; but he was not militant enough to please his fierce co-presbyters. They appeared to him, who had studied far more deeply than any Scotchman of his time the various ecclesiastical polities of Christendom, truculent about trifles. According to bishop Burnet, "he soon came to dislike their covenant, particularly their imposing it, and their fury against all who differed from them. He found they were not capable of large thoughts; theirs were narrow as their tempers were sour; so he grew weary of mixing with them." Yet we cannot altogether approve the facility with which he fraternized with the party that had inflicted such horrid cruelties on his excellent father, Dr. Alexander Leighton, in 1630, for merely publishing a book in favor of Presbyterianism. In 1652 he resigned his charge, and in the following year was elected principal of the university of Edinburgh, a dignity which he retained for ten years. Earnest, spiritual, and utterly free from all selfish ambition, he labored without ceasing for the welfare of the students. After the restoration of Charles II., Leighton, who had long separated himself from the Presbyterian party, was, after much reluctance, induced to accept a bishopric. He chose Dunblane, because it was small and poor. Unfortunately for his peace, the men with whom he was now allied were even more intolerant and unscrupulous than the Presbyterians. The despotic measures of Sharpe and Lauderdale sickened him. Twice he proceeded to London (in 1665 and 1669) to implore the king to adopt a milder course—on the former of these occasions declaring "that he could not concur in planting of the Christian religion itself in such a manner, much less a form of government." Nothing was really done, though much was promised, and Leighton had to endure the misery of seeing an ecclesiastical system which he believed to be intrinsically the best, perverted to the worst of purposes, and himself the accomplice of the worst of men. In 1670, on the resignation of Dr. Alexander Burnet, he was made archbishop of Glasgow; an office which he accepted only on the condition that he should be assisted in his attempts to carry out a liberal measure for "the comprehension of the Presbyterians." His efforts, however, were all in vain; the high-handed tyranny of his colleagues was renewed, and Leighton felt that he must resign, which he did in 1673. After a short residence in Edinburgh, he went to live with his sister at Broadhurst, in Sussex, where he spent the rest of his days in a retired manner, devoted chiefly to works

of religion. He died June 25, 1694. Leighton's best works (he published nothing during his lifetime) are to be found in an edition published at London (4 vols., 1825). All his writings are pervaded by a spirit at once lofty and evangelical. The truths of Christianity are set forth in the spirit of Plato. It was this that recommended them so much to Coleridge, whose *Aids to Reflection* are only commentaries on the teaching of the saintly archbishop.

LEIGHTON-BUZZARD, a market t. of England, Bedfordshire, is situated in a large agricultural district, 40 m. n.n.w. of London. It has claims to considerable antiquity—its church was erected in the beginning of the 13th c., and in its market-place is an ancient and elegant pentangular cross. Many of the inhabitants are employed in making straw-plait. Pop. '71, 4,696.

LEIN'INGEN, the name of one of the wealthiest of the mediatised houses of Germany, was formerly applied to a German co. in the district of Worms and Spires, with which, in the beginning of the 13th c., the co. of Dachsburg became connected as part of the family possessions. The family is one of the oldest still existing in Germany. In 1779 the head of one of the branches into which it had become divided, the count of Leiningen-Hardenburg-Dachsburg, was raised to the rank of a prince; but the peace of Lunéville deprived him of his ancient possessions—about 252 sq.m. in extent, on the left bank of the Rhine. He received, however, a compensation in other parts of Germany; and though no longer an independent prince, the princely head of the house of Leiningen retains his rank and wealth, his possessions being within the territories of Baden, Bavaria, and Hesse.

LEIN'STER, one of the four provinces of Ireland, occupies the s.e. portion of the country, and is bounded on the e. by St. George's channel and the Irish sea. Area, 4,876,933 acres; pop. '71, 1,339,451. At the period of the invasion by England (1170) this province formed two kingdoms, those of Leinster and Meath. Previously to the reign of Henry VIII., the province had been divided into the counties of Dublin, Meath, Louth, Kildare, Carlow, Kilkenny, and Wexford. The following counties were erected subsequently: Wicklow, formed from a portion of the co. of Dublin; West Meath and Longford, from a part of Meath; and King's and Queen's counties, formed out of part of Kildare.

LEI'PA, or **LEIPPA**, a t. of Bohemia, 42 m. n.n.e. from Prague. It is a place of considerable industrial activity, having manufactures of woolens, cotton, glass, and earthenware. Pop. '69, 9,244.

LEIPOA, a genus of gallinaceous birds, of the family *megapodidæ*, of which the only known species is *L. ocellata*, a native of Australia, inhabiting sandy and bushy plains. It is called leipoa, or NATIVE PHEASANT, by the colonists. Like the Australian jungle-fowl, the leipoa constructs mounds of sand, or earth, and leaves, in which to lay its eggs. More than a dozen are often found in a nest. They are about three times as large as those of a common fowl, and are much esteemed as food. When pursued, it seeks to escape rather by running and hiding in the bush than by the use of its wings. Few birds seem more likely to prove useful in domestication than the leipoa.

LEIP'SIC (formerly *Libzk* or *Lipzk*, said to mean the home of the linden or lime trees, from the Slavic *Lip* or *Lipa*, a lime-tree), a city of the kingdom of Saxony, situated about 65 m. w.n.w. of Dresden, near the Prussian border, in a large and fertile plain. The Elster, the Pleisse, and the Parthe flow through or past the city, and unite about 3 m. below it. The inner or ancient city was formerly surrounded by walls, which have now disappeared, but it is still separated from the far more extensive suburbs (*Friedrichsstadt*, *Johannes-stadt*, etc.) by promenades planted with beautiful avenues of lime and chestnut trees. Many of the streets of the inner city are narrow and crooked; those of the more modern part (which contains also a number of fine squares) are wide and well built. The sanitary state of the city has been much promoted by an extensive and costly system of sewers. The inner city is the principal seat of business and merchandise. The population in 1871 was 106,925; and in 1875, 127,387. The vast majority are Protestants, mostly belonging to the Lutheran church. Of the public buildings of Leipsic few are in any way remarkable. The two principal city churches, the *Thomaskirche* and the *Nicolaikirche*, date from 1496 and 1525 respectively. The stately *Rathhaus* (town-hall) was built in 1556. Of the three castles which formerly existed, only one remains, the *Pleissenburg*, now used for government offices and barracks; the ditch has become a place for drill; and the tower is now an observatory. The finest buildings in Leipsic are the museum, built 1856-58, and the new theater, one of the largest and handsomest in Germany. Near it are the main buildings of the university, which is, however, now equipped with spacious anatomical, physiological, and other laboratories in other parts of the town. The university owes its origin to the removal of a large number of German students from Prague to Leipsic in 1409, in consequence of disputes between the Bohemians and Germans. It has always maintained a high reputation among the universities of Germany, and many distinguished names are connected with it. There are upward of 100 professors and 35 lecturers on the teaching staff; and the number of students, close on 3,000, is larger than at any other German university. The library contains 300,000 vols. and 2,500 MSS.; and the city library has 100,000 vols. and 2,000 MSS.

Leipsic is the center for the administration of a wide district; and in 1877 it has been made the seat of the supreme courts of justice for the German empire. The town has many educational institutions, including two gymnasia, several benevolent foundations, numerous scientific associations, and various institutions for the cultivation of the fine arts. In particular may be mentioned the conservatorium of music, which is reckoned one of the first in Europe. See CONSERVATOIRE.

The three annual fairs (held at Easter, Michaelmas, and the new year, and lasting from three to five weeks) add much to the importance of Leipsic, and render it, with the exception of Hamburg, the greatest seat of trade in Germany. The origin of these fairs is traced back for more than 600 years. They are attended by Jews, Turks, Greeks, Armenians, Persians, and even (of late) by Chinese. The accession of Saxony, in 1833, to the German customs union (*Zollverein*), and the opening of railways, produced a great increase of the concourse and of the business at these fairs, which had previously begun to decline. Transactions to the extent of 70,000,000 thalers (above £10,000,000 sterling) now take place at the Easter fair. The wool-market, which was instituted in 1826, and is held for three days in June, is much frequented.

Leipsic is the principal seat of the book-selling and publishing trade in Germany, and indeed, in this respect, ranks third among the cities of the world, coming immediately after London and Paris. Upwards of 300 houses are engaged in the book-trade. There were also, in 1871, 50 printing establishments. Here the German book-sellers have founded a common exchange, and annual settlements of accounts take place at the Easter fair. One thousand houses are then represented by their commissioners at Leipsic. In consequence of this activity, Leipsic has become the principal seat of type-founding in Germany. Among its other manufactures are piano-fortes, scientific instruments, wax-cloths, oils, chemical products, perfumes, etc.

The city sprung up round a castle built by king Heinrich I., at the junction of the Pleisse and the Parthe. It is first mentioned as a town in 1015, and in the latter part of the 12th c. had from 5,000 to 6,000 inhabitants. It gradually increased in prosperity and importance. The famous *Leipsic conference* between Luther, Eck, and Carlstadt, in 1519, greatly tended to the promotion of the reformation. Leipsic suffered greatly in the thirty years' war, in which it was five times besieged and taken, and again in the seven years' war; and although the commercial changes connected with the French revolution at first affected it very favorably, yet it suffered not a little amidst the terrible struggles of the years 1812 and 1813, when it was alternately in possession of the French and of the allies.

The immediate neighborhood of Leipsic has been the scene of two battles of great importance in the history of Germany and of Europe—the battle of Leipsic, or of Breitenfeld (q.v.), on Sept. 7, 1631; and the great battle of Leipsic—called the *battle of nations*, which continued for three days—from Oct. 16 to 18, 1813. The latter was one of the most bloody and decisive of those which effected the deliverance of Europe from French domination. The troops under Napoleon in this battle amounted to about 180,000 men, and those of the allies, commanded by prince Schwarzenberg, marshal Blücher, and Bernadotte, crown-prince of Sweden, to almost 300,000. The loss of the French was reckoned at about 38,000 killed and wounded, and 30,000 prisoners; that of the allies to about 48,000. The victory of the allies was complete, and the French had to evacuate Leipsic.

LEIPSIC, COLLOQUY OF. The disputes in the 16th c. between the Lutherans and Calvinists having become very acrimonious, and attempts at reconciliation by several persons having been unsuccessful, the authorities and the people were convinced that greater efforts should be made to secure, if not unity, at least peace and harmony between the two churches. A conference was proposed by the theologians of Hesse and Brandenburg to those of Leipsic. The elector George of Saxony having sanctioned the plan of a private conference, the meetings commenced Mar. 3, 1631, at the residence of the upper court preacher, and, under his presidency, were held daily until Mar. 23. The confession of Augsburg was adopted as a basis, and every article examined separately. They agreed on the articles V. to VII. and XII. to XXVIII., but differed as to III., the Lutherans maintaining that not only the divine but the human nature of Christ possessed omniscience, omnipotence, etc., by virtue of the union of the two natures in his person, and that the glory which Christ received was only by his human nature; the reformers, on the contrary, denying that Christ, as man, was omniscient and omnipresent. On the tenth article they could not agree, the reformers denying the physical participation in the body and blood of Christ in the eucharist, and asserting a spiritual participation by faith. The reformers desired, if they could not agree on this point, that the two parties should be charitable to each other, and unite in opposition to Romanism. The Lutherans said the proposition must be further considered in the fear of the Lord. On the article concerning election, the reformers based election on the will of God, and reprobation on the unbelief of man; while the Lutherans regarded election as the result of God's prescience of the faith of the elect. No decided and permanent benefit resulted from the colloquy.

LEISLER, JACOB, b. Frankfort, Germany; d. in New York, 1691; was in the military service of the Dutch E. I. company, and in 1660 came to America, and went into

business on his own account. He was for a time a resident of Albany, where he became concerned in some church troubles, out of which grew litigation and contention which affected both his moral and financial standing. He afterwards settled in New York, and in 1678 sailed for Europe, but was captured by pirates, and only regained his liberty on the payment of a heavy ransom for those days—2,050 pieces of eight, or Spanish dollars. He returned to New York, and five years later was appointed a commissioner of the court of admiralty. In 1688, Francis Nicholson being governor of the province, Leisler took advantage of the English revolution to attempt an overthrow of the local government and the seizure of the administration. He overcame the party favorable to king James, declared for the prince of Orange, and seized the fort and confiscated the public funds. He planted a *battery* of six guns within the fort—thus giving the name to that portion of the island which it has borne ever since—and then proceeded to invest the northern part of the province, having been appointed commander-in-chief by the committee of safety. In Dec., 1689, he assumed the title of lieut.gov. under an indefinite dispatch from William and Mary, and refused to acknowledge the authority of gov. Sloughter on the latter's appointment to that office. He was accordingly seized and imprisoned, and, on a trial for murder and high treason, was condemned to death, which sentence was executed in New York, May 16, 1691. Leisler's condemnation was considered to have been unjustly effected, and the act of attainder which was passed upon him was afterwards reversed, his heirs indemnified through the influence of gov. Bellamont, and his remains exhumed and honorably reinterred in the Dutch church in Garden street, New York. In 1689 Leisler purchased for the Huguenots the tract called New Rochelle, in Westchester co., N. Y. The petition of his son, which, with other documents referring to this history, is to be found in the *Documentary History N. Y.*, vol. xi., sets forth the nature of the labors of Jacob Leisler, sen., in behalf of the interests of William and Mary, and in behalf of the Protestant religion, and presents the case on which the act of attainder was eventually rescinded.

LEITH, an important seaport, a municipal and parliamentary burgh of Scotland, on the southern shore of the firth of Forth, at the mouth of the water of Leith, 2 m. n. of Edinburgh, with which it is now connected by a continuous line of houses. Although not without many fine edifices, the town, as a whole, is rather mean in appearance, being irregular and dingy, especially in the older and central parts. The Trinity-house, custom-house, town-hall, royal exchange, corn exchange, and banks are really handsome buildings. Leith has one of the largest and most elegant flour-mills in the kingdom. West of the town, on the shore, is Leith fort, an artillery station. Leith is connected by branch-lines with the various railways centering in Edinburgh. The harbor extends, by means of two piers, upwards of a mile into the firth, and has a depth of from 20 to 25 ft. at high-water. There are three wet-docks, containing a floating area of 26 acres; and an additional dock is in course of construction which is to contain a floating area of nearly 17 acres. Railway communication is continued from the various Leith stations throughout the quays, and to the extremity of the western pier, and has also been carried across the harbor by a superior iron swing-bridge. There are six graving-docks, one of them being 73 ft. wide at the entrance, and 450 ft. in length, with 24 ft. of water on the sill at spring-tides. The trade of the port is chiefly in colonial and foreign produce, but is also extensive in coal and iron exports. Grain, timber, and wine are among the leading imports. In 1840 the harbor dues were £26,000; in 1875 upwards of £74,000. In 1852 the tonnage of *arrivals* was 350,286, while in 1878 it was 962,375; and the tonnage of *sailings* shows a corresponding increase. In 1875 the imports of grain amounted to 768,120 qrs., and those of flour to 245,515 bags. The fishing village of Newhaven is within the port. There is a daily market. Chief manufactures—ships, machinery, sail-cloth, ropes, ale, rectified spirits, soap, bottles, flour. Pop. '71, 44,277. Leith unites with Portobello and Musselburgh in sending a member to parliament.

LEITHA, an Austrian stream rising in Lower Austria, and flowing n.e. to join the Danube nearly along the frontier of Lower Austria and Hungary. Since the reorganization of the empire in 1867, it has become usual to speak of Hungary and the lands belonging to the Hungarian crown as *trans-leithan*, and the rest of the empire as *cis-leithan*—thus giving the stream a factitious importance.

LEITHA (*ante*), a river in Austria, forming part of the western limit of Hungary, dividing it from Lower Austria. Flowing into the river Raab, a branch of the Danube, it forms an island on which is situated the market-town of Altenburg, in Hungary, 47 m. s.e. of Vienna. It rises at Haderswerth, between Cisleithania, in Lower Austria, and Transleithania, in Hungary, the etymology of their names being attributable to its vicinity. It makes its course along a valley of the Leitha mountains, which rise from 1500 to 2,000 ft. between it and the Neusiedler-See, passing through them into Hungary. It is a sluggish stream, its course lying among marshes and fertile plains. Its waters furnish an abundance of fish.

LEITMERITZ, or LITOMIERCZICZE, an old walled t. of Bohemia, on the r'ght bank of the Elbe, 34 m. n.n.w. from Prague. One of the churches has a tower like a cup, a curious memorial of the fierce religious contest in the 15th c. as to the use of the cup by the laity in the Lord's supper. Much of the Bohemian glass is polished in Leitmeritz, and it has an active trade in corn, wine, fruit, and fish. Straw hats and chicory are

also among its articles of produce. It is celebrated for a kind of apple called the *Borsdorff*, which is sent in large quantities both to Berlin and St. Petersburg. Pop. '69, 10,023.

LEITNER, GOTTLIEB WILLIAM, PH.D., b. at Pesth, Hungary, 1830. His father, a German physician, becoming involved in the revolution of 1849, went to Turkey, where Gottlieb, who had been well instructed in the classics, became master of the Turkish, Arabic, and modern Greek. He also learned English, French, and Italian at the British college in Malta, and was interpreter to the English commissariat during the Crimean war. After the war was over he went to London, was naturalized as a British subject, and accepted an appointment as professor of oriental languages and Mohammedan law in King's college. In 1864 he was appointed director of a college at Lahore, in the Punjab. In that country he founded many societies, schools, public libraries, and colleges, and established several newspapers, thus setting in play large influences for the enlightenment of the people. He organized the Punjab university upon a solid basis. He also found time to engage in the exploration of Thibet and the other countries n. of the Himalayas, discovering Dardistan, with its interesting group of languages. He also extended his philological researches to the languages of Cabool, Cashmere, and Badakhshan, and sent to the Vienna exposition an extensive collection of Central Asiatic antiquities. His principal works, besides numerous contributions to the collections of learned societies in England and upon the continent, are a *Philosophical Grammar of Arabic*, in the English, Urdu, and Arabic languages; *The Races of Turkey*; a *Comparative Grammar of the Dardu Languages*; *History, Songs, and Legends of Dardistan*; and *Graeco-Buddhist Discoveries*.

LEITOMISCHL, or LEUTOMISCHEL, a t. of Bohemia, 84 m. e.s.e. from Prague. It stands on the left bank of the Launcha, an affluent of the Elbe. A castle, erected in the 16th c., is esteemed one of the finest buildings of its kind in Bohemia. Leitomischl has manufactures of linen, and an active trade in corn, fish, and wine. Pop. '69, 7,021.

LEITRIM, a co. of the province of Connaught, in Ireland, which to the n. has a small coast-line on the bay of Donegal. Area 613 sq.m., or 392,363 acres, of which 249,350 are arable. The surface of Leitrim is irregular. It is divided into two parts by a considerable lake called Lough Allen. The southern division is broken up by low narrow ridges, which inclose numerous small lakes, the chief of which is called Lough Rinn. The more level portion of this division of the county forms part of the great limestone plain of Ireland, and contains some excellent arable and pasture land. The northern division is much more irregular in surface, being intersected by several ridges of considerable elevation. To the n. of Lough Allen the soil, except at rare intervals, is unfavorable for agriculture, and the climate is damp and ungenial. The principal crops are potatoes, oats, and hay; but, on the whole, the condition of the agriculture, considering the many inventions and improvements recently made, is not forward, the total number of acres under crops of all kinds having been, in 1877, 83,148. Leitrim, however, is more a grazing than a tillage district. Large quantities of horned cattle are raised in the southern division. The total number of cattle in 1877 was 93,266; of sheep, 13,717. Turf is abundant in all parts of the county. The pop. in 1871 numbered 95,562. Of these, 85,974 were Roman Catholics, 8,385 Protestants of the Episcopal church, and the rest Protestants of other denominations. The number of children attending national schools in 1876 was 24,478. The river Shannon (q. v.) enters this county near its source in Cavan, and traversing Lough Allen, passes out at the southern extremity of Leitrim. Of other rivers, the Bonnet, the Yellow river, and the Daff may be especially mentioned. The only towns of any note are Carrick-on-Shannon, Manor-Hamilton, and Mohill. The northern division of the county is more rich in minerals than most districts of Ireland. Coal is found in the Lough Allen basin, the chief working-beds being in the Slieve-an-Ierin mountains, where it is raised for smelting purposes. In the same district is found iron, the ore of the Arigna mines yielding as much as 58.2 per cent of metal. Lead ore is also abundant, although the mining operations have been discontinued. The occupation of the people being chiefly agricultural, there are hardly any manufactures.

Leitrim anciently formed part of the territory of Breifne O'Rourk. It was reduced to the English submission in the reign of Elizabeth, but revolted in 1588, submitting once more in 1603, when the O'Rourk accepted a patent of the residue of his estate. The confiscations which followed the great civil war may be said to have extinguished the native proprietary and the family of O'Rourk.

LE JEUNE, PAUL, 1592-1664. He went to Canada in 1632, as first superior of the Jesuit missions, remaining in that position till 1639; and on his return to France was procurateur of foreign missions. He was editor of some of the Jesuit *Relations*.

LE KAIN, HENRI LOUIS CAIN, 1728-78; b. Paris. Voltaire was attracted to him by witnessing his early attempts in amateur representation, and procured for him an opportunity to appear in the Theatre Français, where he achieved a distinguished position in spite of great opposition, and faults which his genius at last overcame. He ranks among the most eminent French tragedians. His great rôles were in the tragedies of Voltaire. His *Mémoires* were reprinted in Paris under the direction of Talma in 1825.

LELAND, CHARLES GODFREY, b. Philadelphia, 1824. After graduating at Princeton in 1846, he traveled in Europe, and continued his studies at the universities of Heidelberg, Munich, and Paris. He was in the latter city during the outbreak in Feb., 1848, and joined the students of the Latin quarter behind the barricades. Returning to America the same year, he prepared for the bar, but concluded to devote himself to a literary career. He wrote at first for the periodicals, *Graham's*, *Sartain's*, and the *Knickerbocker* magazines, and edited the first of these at one time. He has made a study of the Gypsy or Rommany language and history, and of dialect writing. He has also obtained reputation as a German scholar. It is probable, however, that Mr. Leland's fame will rest chiefly on his work as a humorist, in which capacity he has contributed freely to American literature. He has published *Sketch-Book of Meister Karl*, 1855; *The Poetry and Mystery of Dreams*, 1855; *Pictures of Travel*, translated from the German of Heinrich Heine, 1855; *Heine's Book of Song*; *Sunshine in Thought*, 1862; *Legends of Birds*, 1864; *Hans Breitmann's Ballads*, 1867-70; *Poems*, 1871; *Egyptian Sketch-Book*, 1873; *English Gypsies and their Language*, 1873; *Fu-Sang*, 1874; and *English Gypsy Poetry*, 1875; the last being issued with the collaboration of Miss Janet Tuckey and prof. E. H. Palmer. Mr. Leland has also practiced journalism to some extent, having been employed on the editorial department of the *Philadelphia Press* and *Evening Bulletin*—and for a time as editor of *Vanity Fair*, a humorous and satirical weekly paper, published in New York during the rebellion. He resided in Europe and traveled extensively during a number of years prior to 1880, when he returned to America, and settled in Philadelphia.

LELAND, JOHN, D.D., an English divine and apologist for Christianity, was b. at Wigan, in Lancashire, in 1691, became a dissenting minister in Dublin 1761, and first appeared as an author in 1733 by publishing a reply to Tindal's deistical work, *Christianity as Old as the Creation*. In 1737, appeared another apology, *The Divine Authority of the Old and New Testament asserted against the Unjust Aspersions and False Reasonings of a Book entitled "The Moral Philosopher."* As the learning displayed in these works was great, and the abilities considerable, the university of Aberdeen conferred on Leland the degree of D.D. His best work is *A View of the Principal Deistical Writers that have appeared in England*. It once held a high position in Christian apologetic literature, and many people still regard it as a satisfactory demolition of deism. Leland died in 1766. To his honor it should be added, that though his life was one of controversy, the spirit of fairness and charity never forsook him.

LELAND, JOHN, 1754-1841; b. Grafton, Mass. He was baptized by immersion in 1774, and shortly afterwards licensed as a Baptist preacher. In 1775 he removed to Virginia, where, until 1791, with the exception of occasional visits to the north, he was earnestly engaged in the discharge of his professional duties. In 1792 he settled at Cheshire, Mass., which was thenceforth his home most of the time until his death. He preached in a great number of places, and is said to have baptized a larger number of persons than any of his contemporaries. He took the warmest interest in politics throughout his life, being a pronounced democrat and an enthusiastic admirer of Jefferson, and after that statesman became president of the United States, in 1801, he went to Washington to present to him a mammoth cheese, weighing 1450 lbs., as a testimonial of the esteem and confidence of the people of Cheshire. This event was much talked of at the time, being regarded as a fresh illustration of the famous preacher's eccentric character. Many of his sermons, like those of the preachers generally of that day in New England (who, unlike him, were mostly federalists), had a strong flavor of politics. He left an autobiography, which, together with additional notices of his life, and selections from his writings by Miss L. F. Green, was published in 1845.

LELAND, or LAYLONDE, JOHN, 1500-52; b. England; having under the patronage of Thomas Myles studied ancient and modern languages at St. Paul's school with William Lilly as instructor, and at Cambridge and at Oxford, he pursued the same studies in Paris. In 1533, having filled the office of chaplain to Henry VIII., who gave him the rectory of Popeling, near Calais, and made him librarian, he was commissioned as his antiquary to explore the antiquities of the cathedrals, colleges, abbeys, and priories of his realm, receiving a stipend and a consideration for non-residence on his living. On his return in 1542 he was rewarded by Henry VIII. with the rectory of Hasely, in Oxfordshire, and a canonry of King's college, Oxford. In 1545, having lost his canonry by the surrender of that college to the king, he was awarded the prebend of East and West Knowle, in the church of Sarum. He was celebrated as a linguist and poet. In 1549 there appeared from his pen *A New Yeare's Gift to King Henry VIII. in the 37th Yeare of his Raygne*. During the preparation of his voluminous manuscripts he withdrew to his house in the parish of St. Michael le Querne, London. In 1709 his *Commentarii de Scriptoribus Britannicis* appeared in 2 vols.; in 1710-12, *Itinerary of England*, 9 vols.; in 1715, *De Rebus Britannicis Collectanea*. His manuscripts which descended from Humphrey Purefoy to Burton, the historian of Leicestershire, were deposited by him in the Bodleian library at Oxford; others that came into the possession of sir Robert Cotton, were placed in the British museum. He was associated with Nicholas Udall in preparing the English and Latin verses which were recited on the occasion of the coronation of Anne Boleyn. *Leland's Remains* were a convenient fund for Stowe, Camden,

Lambarde, Dugdale, and Burton to draw upon in their antiquarian works. He was buried in the church of St. Michael le Querne. For several years previous to his death his mind was disordered, the result of protracted and solitary study.

LELAND, THOMAS, D.D., 1722-85; b. Ireland; educated at Trinity college, Dublin, where in 1763 he was elected professor of poetry. He published several works, the most prominent of which were translations of the *Orations of Demosthenes*; *History of the Life and Reign of Philip King of Macedon*; *Dissertation on the Principles of Human Eloquence*; a *History of Ireland*; several volumes of sermons, and a controversial work against bishop Warburton.

LELÉGES, a race which in ancient times peopled the islands of the Ægean, and is supposed to have been of Pelasgic origin. Authorities differ as to its exact identity, some having confused the Leléges with the Carians, with whom they are said to have united in support of the Trojans. Homer represents Altes, king of the Leléges, as having been the father-in-law of Priam. Pausanias considers Lelex, the founder of this race, to have been a foreigner from Egypt, and that he became king of Megara. According to this authority, the grandson of Lelex, Pylus by name, founded the city of Pylus in Messenia with a colony of Megarian Leléges. The last that is recorded of the Leléges is that they joined the Carians in colonizing the w. coast of Asia Minor.

LELEUX, ADOLPHE, b. at Paris, 1812; became an accomplished engraver and lithographer, and afterwards won distinction as a genre painter. His pictures represent with vivid force scenes of life in Brittany, northern Spain and Algeria, and in the streets of Paris during the revolution of 1848. His brother, ARMAND, b. in Paris in 1818, studied under Ingres and in Italy, but turned his attention to genre painting. He has a finer appreciation of picturesque scenes than his elder brother, but less humor and power of expression.

LELE'WELL, JOACHIM, 1786-1861; b. at Warsaw, Poland; studied at his native place and at Vilna; in 1809 was appointed professor of history at the lyceum of Kremnets in Volhynia, and at the university of Vilna in 1814. In 1824 he was dismissed upon suspicion of being engaged in secret revolutionary proceedings, and the next year was elected a member of the Polish diet. He was prominent as a leader in the Polish uprising of 1830, and when it failed, fled to France, where he lived three years, and was then banished for participation in several Polish conspiracies. He went to Brussels and devoted himself to science until his death. His scientific writings are extensive and of high value. Among his works is a *History of Poland*, greatly esteemed.

LELY, Sir PETER (PETER VANDER FAES), was the son of one Vander Faes, a capt. of a regiment of infantry, who was generally called Le Capitaine du Lys, or Lely, from having been born at the Hague, in a house the front of which was decorated with a fleur-de-lis. Lely was born at Soest, in Westphalia, in 1618. His father placed him in the school of Peter Grebber, a painter of talent at Haarlem, where he remained two years. He commenced his career as a painter of landscapes and subjects from history; but his talent induced him to devote himself exclusively to portrait painting, and soon after the death of Van Dyck he settled in London. He was employed successively by Charles I., Cromwell, and Charles II., who nominated him court-painter, and conferred on him the honor of knighthood. He had great facility of execution, and his style, though deficient in all the higher qualities of art, was well suited for his position as the favorite portrait painter of such a court as that of his chief patron. There is a large collection of his portraits at Hampton court, well known to the numerous visitors of the public apartments there as the beauties of the court of Charles II. He died in London in 1680.

LEMAIRE, NICOLAS ÉLOI, 1767-1832; b. France; became professor of rhetoric in Paris in 1790; was a warm advocate of the revolution; was deputy judge in 1793. He delivered improvisations in Latin in Italian cities, and is best known as the compiler of the *Bibliotheca Classica Latina*, in 154 vols., Paris, 1818.

LEMAITRE, FRÉDÉRIC, 1798-1876; b. France; the son of professional actors. He studied for the stage at the conservatoire of Paris, and had the advantage of the sympathy and aid of the great Talma. His first appearance was made at the Odéon, but it was not until some time after that occasion, in 1826, that he became a member of the Odéon company. He did not remain permanently engaged in any theater, his taste and habit of mind leading him into a wandering life, and appeared sometimes at the Ambigu, sometimes at the Porte Saint-Martin, as occasion offered. It was in 1832 that he created the character of "Robert Macaire," in which he won immortal renown, being joint author of the play as well as the originator of the title rôle. He made a tour of England in 1835, achieving a marked success. His performance of the *Ruy Blas* of Victor Hugo became another of his triumphs, and this was followed by that of *Don César de Bazan*, which he produced at the Porte Saint-Martin with the result of nearly occasioning an émeute, for some reason, between the people and the police, troops having to be summoned and the theater closed for three days. At the outbreak in Paris of the revolution of 1848, Lemaitre astounded the audience of the Porte Saint-Martin by rushing to the front of the stage, half-dressed, with a gun in his hand, and urging those in front of him to join their fellows in the street and "play a citizen-like part in the great drama, the epilogue of which must be the apotheosis of the people." In 1868, after

a number of years of absolute retirement from the stage on account of the death of his eldest son, Lemaitre made a reappearance at the age of 70 years. This actor achieved his greatest reputation in strong character-parts, the mobility of his features, and the skill with which he grasped and elucidated marked and original traits, rendering him exceptionally qualified for this kind of personification.

LE'MAN, LAKE. See GENEVA, LAKE OF.

LE MANS. See MANS, *ante*.

LEM'BERG (formerly *Löwenburg*, "city of the lion;" i.e., of *Leo Danielowicz*, prince of Halicz, who founded it in 1259; Polish name, "Liwów"), the capital of the Austrian kingdom of Galicia and Lodomeria, is situated on a small stream called the Peltew, in a narrow basin among hills. Lat. $49^{\circ} 50'$ n., long. 24° east. Pop. '69, 87,105, of whom a great number are Jews. Lemberg is the seat of a Roman Catholic, a Greek United, and an Armenian archbishop, and has 29 (it once had 50) churches. It is one of the finest towns in Austria, yet the houses are for the most part roofed with shingle. The synagogues, in particular, are very beautiful. The university (*Alma Francisea*), founded in 1784, had in 1872 46 professors and 1031 students. The university library contains 55,000 volumes, 350 MSS., and a collection of coins amounting to 10,000. Here also is the seat of the institute founded by Ossolinski, with a library of 62,000 volumes, and 1200 MSS., chiefly of Polish literature. The trade and manufactures of Lemberg are of great importance. The town is now regularly fortified.

LÉMERY, NICOLAS, 1645-1715; b. at Rouen; studied pharmacy in Montpellier, Paris, and elsewhere, and became a lecturer on chemistry, drawing great crowds by his fascinating expositions of the subject and his freedom from the popular absurdities long associated with the science. He belonged to the Reformed church, and thus became involved in troubles, from which he sought exemption in England. He was well received by Charles II., to whom he presented a copy of the 5th edition of his *Cours de Chimie*, published in 1675. It was not long, however, before the political troubles of England induced him to return to Paris, and, after the revocation of the edict of Nantes, when he had lost his right of practicing as an apothecary and physician, he united himself with the Roman Catholic church and renewed his former vocation of lecturer and writer.

LEM HI, a co. in central Idaho, having the Bitter Root range of the Rocky mountains for its n. and e. boundary, separating it from Montana territory, is watered by Lemhi river, Rock creek and North Fork, tributaries of the Salmon river, which runs n.w., entering the Snake river; about 2,000 sq.m.; pop. '70, 988-120 Chinese. In the s.e. portion is the Lemhi Indian reservation. Its surface is mountainous, with a few fertile valleys which yield the products of the dairy, furnish good pastureage, and present scenery of wonderful grandeur and beauty. Gold placer mining is the principal occupation of the inhabitants. It had in '70, 7 gold placer mines, employing 64 men, with a capital of \$42,750 and a product of \$113,000. It had also one gold quartz mine, with a capital of \$3,000 and a product of \$5,000. Seat of justice, Salmon City.

LEMMA (Gr. a thing assumed), a preparatory proposition introduced for the purpose of rendering the demonstration of a theorem or construction of a problem more perspicuous. The term is confined to the science of mathematics.

LEMMING, *Lemmus* or *georychus*, a genus of rodent quadrupeds, of the family *muridae*, and sub-family *arvicolidae*, nearly allied to voles, but differing from them in the extreme shortness of the ears and tail, and in having larger and stronger claws, more adapted for digging. They are also more heavily formed. The most noted species is the Scandinavian lemming (*L.* or *G. Norvegicus*), an animal of about 5 in. long, with variegated black and tawny fur, an inhabitant of the northern Scandinavian mountains, where it ordinarily feeds on reindeer-moss and other lichens, grass, catkins of birch, etc. But, breeding often in the course of a year, and producing four or five at a birth, it multiplies so much that periodically vast troops leave their native regions, migrating either toward the Atlantic ocean or the gulf of Bothnia. Bears, wolves, foxes, lynxes, follow and prey upon them. Hawks and owls also attend and contribute to the diminution of their numbers. It is said that those which survive, after spending a winter in the region to which they have migrated, seek to find their way back to their original abode. In times of prevalent superstition lemmings were often exorcised by the priests, and the peasantry of Norway supposed them to fall from the clouds. The Laplanders eat the lemming.

LEMNIAN EARTH, a mineral found in the island of Lemnos; massive, chalk-like, soft, yellowish gray, or whitish, and falling to powder in water. It consists of about 66 per cent silica, with 14 of alumina, and a little oxide of iron, soda, and water. It long had a great and undeserved reputation in medicine, and being sold in little pieces, each stamped with a particular stamp, it acquired the name of *terra sigillata* (sealed earth). The belief in its medicinal power is of very great antiquity. The stamp in ancient times, Galen says, was the head of Diana, the tutelary goddess of Lemnos; but is now only the Turkish name of the mineral. The ancients had more than one legend respecting the discovery of the virtues of Lemnian earth.

LEM'NOS (now commonly called *Stalimne*), an island in the northern part of the Grecian Archipelago, about 40 m. w. of the entrance to the Dardanelles. It is irregular in shape, and is nearly divided into two islands, by two deep bays—port Paradise on the n., and port St. Antony on the south. Area, 150 sq. miles. Pop. about 12,000. The women are famed for their beauty. It is hilly, rather bare of wood, and bears unmistakable traces of volcanic action at an early period, which fact probably originated the ancient myth of Vulcan lighting on this island when Jupiter hurled him from heaven. Moschylos, a volcano, no longer active, was believed to be the workshop and favorite residence of this deity. The principal product of Lemnos is the *Lennian earth* (q.v.), used in ancient times as a cure for wounds and serpent-bites, and still highly valued by both Turks and Greeks. The chief town, Kastron (on the site of the ancient *Myrina*), has a pop. of 2,000. It furnishes excellent sailors.

LEMOINE. See LE MOYNE.

LEMOINNE, JOHN EMILE, b. 1814, of French parents, in London. At the age of 26 he became known through the *Journal des Débats* as the English correspondent from London. His enlarged views in politics, sagacity of judgment, and refinement of style soon made him one of the eminent writers of his time. He was a determined opponent of the French intervention in the affairs of Italy, and of the reactionary despotism of Louis Napoleon. It was through his influence, in conjunction with the eminent financier M. Leon Say, that the *Journal des Débats* changed from a semi-monarchical to a frankly republican journal. At the beginning of the tentative administration of M. Thiers his pen was among the most trenchant of weapons against the various heads of the monarchic hydra that were incessantly voicing their fears of the republic. Though the bulk of M. Lemoinne's work has been journalistic, he has written a large number of pamphlets on a great variety of subjects, mostly political, which have had a wide reading both in France and England. A sheaf of some of these is entitled *D'Études Biographiques et Critiques*, published in 1862. He has been one of the regular contributors to the *Revue des Deux Mondes*, and editor of the *Journal des Débats*.

LEMON, *Citrus limonum*, a tree which has by many botanists been regarded as a variety of the citron (q.v.), and, like it, a native of the n. of India. Its leaves are ovate or oblong, usually serrulate, pale green, with a winged stalk; the flowers are streaked and reddish on the outside; the fruit is oblong, wrinkled or furrowed, pale yellow, with generally concave oil-cysts in the rind. In the common variety, which is very extensively cultivated in many tropical and sub-tropical countries, the pulp of the fruit is very acid, abounding in citric acid. There is, however, a variety called the sweet lemon, occasionally cultivated in the s. of Europe, of which the juice is sweet. It is *citrus lumia* of some botanists, and has both concave and convex oil-cysts in the rind. The acid juice of the common lemon is much used in the preparation of the well-known cooling beverage called *lemonade*, and is also administered in various forms in febrile and scorbutic complaints. It is much used by calico-printers to discharge colors, to produce greater clearness in the white part of patterns, dyed with dyes containing iron. As a preventive of sea-scurvy, it is an important article of sea-stores. Citric acid and lemon-juice are likewise made from it in great quantities. The rind of the fruit (*lemon-peel*), separated from the pulp, and kept in a dried state, is a grateful stomachic, and is much used for flavoring. The produce of the lemon-groves of Italy, the Tyrol, Spain, Portugal, the s. of France, and other countries bordering on the Mediterranean sea, is largely exported to more northern regions. Sicily alone exports annually 30,000 chests, each containing 440 lemons. The lemon-tree is very fruitful; it is more hardy than the orange, and in some parts of the s. of England produces very good crops, being trained to a wall, and protected by a movable frame in winter.—The lemon is supposed to have been introduced into Europe during the Crusades. It is almost naturalized in the s. of Europe. It is so completely naturalized in some parts of the s. of Brazil, that the flesh of the cattle which pasture in the woods acquires a strong smell of lemons, cattle being very fond of the fallen fruit.

LEMON, MARK, 1809-70; b. London; educated at the grammar-school, Cheam, Surrey; a versatile and fertile writer, who for many years contributed freely to the *Illustrated London News*, Dickens's *Household Words*, and other London periodicals; but who is best known from having been the editor of *Punch* in connection with Horace Mayhew for the first two years of its publication, and sole editor from 1843 to the time of his death. He was the author of more than sixty dramatic pieces, of which *The School for Tigers* and *The Serious Family* are still popular. He wrote also the following books: *The Enchanted Doll* (1849); *A Christmas Hamper* (1859); *Wait for the End* (1863); *Loved at Last* (1864); *Falkner Lyle* (1866); and other novels. He was for a long time literary editor of the *Illustrated London News*; assisted Charles Dickens in the editorial management of *Household Words*; and achieved a considerable reputation as a songwriter.

LEMONADE is formed by adding two lemons sliced, and 2 ounces of white sugar, to a quart of boiling water, and digesting till cold. It is a useful drink for allaying thirst, and as a refrigerant in febrile and inflammatory complaints, and in hemorrhage, in which cases it should be given iced.

LEMON-GRASS, *Andropogon schœnanthus*, a beautiful perennial grass, 3 or 4 ft. high, with panicle mostly leaning to one side, and spikelets in pairs, or, if terminal, in threes. It is a native of India, Arabia, etc., and is extremely abundant in many places. It has a strong lemon-like fragrance, oppressive where the grass abounds. It is too coarse to be eaten by cattle except when young, and is therefore often burned down. Europeans in India make an agreeable stomachic and tonic tea of the fresh leaves. By distillation, an essential oil is obtained (*lemon-grass oil*), which is employed externally as a stimulant in rheumatic affections, and is yellow, with a strong lemon-like smell. This oil is used in perfumery, and is often called *oil of verbena* by perfumiers. Lemon-grass has been introduced into the West Indies, Australia, etc. See also GRASS OIL.

LEMON-JUICE is a somewhat opaque, very sour liquid, obtained from lemons by expression and straining. Its acidity is due to the presence of citric and a little malic acid. Its principal uses in medicine are the following: 1. As an anti-scorbutic.—“Those only,” says sir Gilbert Blane, “who have made themselves acquainted with the early part of the naval history of this country, can duly appreciate the value of this simple remedy.” Its active principle, citric acid, is now frequently substituted for it. 2. In rheumatism.—Dr. G. O. Rees, who first employed it in this disease, “considers the citric acid to undergo changes in the stomach, and to supply oxygen to such elements as tend to produce uric acid, and thereby to induce the formation of urea and carbonic acid instead.” 3. In the formation of effervescent draughts.—A scruple of bicarbonate of potash in solution, mixed with about 3 drams and a half of lemon-juice, so as to form a citrate of potash, forms an excellent effervescent draught; it acts as a mild diaphoretic and diuretic, tends to allay febrile disturbance, and serves to check nausea and vomiting. If the object is specially to determine to the skin, a draught composed of a scruple of sesquicarbonate of ammonia in solution, with 6 drams of lemon-juice, so as to form a citrate of ammonia, is preferable. Effervescent draughts are often employed as agreeable vehicles for the exhibition of other remedies.

LE MONNIER, PIERRE CHARLES, 1715-99; b. France; son of Pierre Le Monnier, a French astronomer and professor of philosophy in the college d'Harcourt; having inherited a love for the study of astronomy, and having proved his aptitude by drawing a correct map of the moon, which he presented to the academy of sciences, was elected a member of that society, as adjunet geometrician, and in the following year was associated with Maupertuis and Clairaut, at Tornea, in measuring a degree of the meridian in Lapland, within the polar circle. He favored the introduction of the methods of Flamsteed, and the superior astronomical instruments of the English. In 1742, by the bounty of the king, to whom he was introduced by the duc de Noailles, he occupied apartments at the Capucins, rue St. Honoré, and held them till the revolution; he also received a royal present of 15,000 livres, in acknowledgment of his services in fixing an accurate meridian at St. Sulpice. From 1732 to 1741 he was engaged in determining the sun's greatest equation, which in the latter year he found amounted to $1^{\circ} 55' 31''$. In 1739 he was elected honorary member of the royal society of London, and for 12 years was its senior member. In 1741 he published *Histoire Céleste*. In 1746 and 1748 he made some successful telescopic observations in relation to the planets Jupiter and Saturn, and an eclipse of the sun. He held the chair of professor of physics in the college of France for many years. In 1746 he published *Institutions Astronomiques*, an elementary work. In 1748 he went to England, and thence to Aberdour, in Fifeshire, Scotland, with the earl of Morton to observe the solar eclipse. In 1771 he published *Nautical Astronomy*, and various treatises on navigation, magnetism, and the variations of the compass, etc. For 50 years his contributions appeared in successive annual publications of the memoirs of the academy. The celebrated Lalande was his pupil. From the year 1791 to his death he suffered from the effects of a paralytic attack. He was one of the 144 original members of the national institute. In 1763 he married Mlle. de Cussy of Normandy, and had three daughters, all of whom married, and the second became the celebrated Lagrange. He was buried at Héric, near Bayeux.

LEMONS, OIL or ESSENCE OF, is extracted from the minute cells which are visible on the rind of the lemon, by submitting raspings of the fruit to pressure in hair sacs. It may also be obtained by distilling the peel with water; but its flavor, when obtained in this way, is less agreeable, although the oil itself is purer, owing to the absence of mucilaginous matter. The distilled oil is sold under the name of *scouring-drops*, for removing grease-spots from silks and other fabrics. Pure oil of lemons is mainly composed of a hydrocarbon, *citren* or *citronyl*, $C_{10}H_8$, which is consequently isometric with oil of turpentine, with which it is often adulterated. It is principally used for the purpose of communicating an agreeable odor to other medicines, although it is sometimes taken in the dose of two or three drops on sugar as a carminative. From its agreeable scent, it is often added to evaporating lotions and to ointments.

LEMONS, SALT OF, a name commonly but improperly applied by druggists to binoxalate of potash mixed with a little of the quadroxalate. This mixture occurs in the *oxalis acetocella*, and hence it has been designated *salt of sorrel*. It is employed in taking out ink-spots.

LE MOYNE, ANTOINE, Sieur de Châteauguay, 1683–1747; b. Montreal; son of Charles; an officer in the French army; accompanied a colony of French to Louisiana in 1704; served under his brother Iberville in campaigns against the English at the n. in 1705–6; commander of the French troops in Louisiana in 1717; commander of the fort at Pensacola in 1719; in command at Mobile soon after; governor of Martinique in 1727. He returned to France in 1744, and became governor of Isle Royal or Cape Breton.

LE MOYNE, CHARLES, 1625–83; b. Normandy; an early French colonist in Canada; distinguished himself as an Indian fighter in wars with the Iroquois, and for his services was ennobled by Louis XIV. in 1668, and made seigneur de Longueil and Châteauguay; afterwards for many years captain of Montreal, where he died.

LE MOYNE, CHARLES, Baron de Longueil, 1656–1729; b. Montreal; son of Charles. Distinguished for participation in the government of Canada, in promoting its colonization, in preparing its defense against the English in 1711, and obtaining the concession from the Iroquois to rebuild fort Niagara in 1726.

LE MOYNE, JACQUES, Sieur de Sainte Hélène, 1669–90; son of Charles; an officer in the French-Canadian service, until his death in 1690.

LE MOYNE, JEAN BAPTISTE. See BIENVILLE.

LE MOYNE, JOSEPH, Sieur de Sevigny, 1668–1734; b. Montreal; son of Charles. In 1694–97, he commanded a French fleet sent to act against the English on Hudson's bay in conjunction with his brother Iberville; afterwards commander of a squadron carrying colonists to form a settlement in Louisiana; surveyed the gulf coast in 1718–19; aided in the capture of Pensacola from the Spaniards in 1719, and repulsed them from Dauphin island the same year. In 1723 was made governor of Rochefort, France, and remained in that position till his death.

LE MOYNE, PAUL, Sieur de Maricourt, 1668–1704; son of Charles; an officer in the French-Canadian service; of large influence with the Indian nations, against whom in war his services were important.

LE MOYNE, PIERRE. See IBERVILLE.

LEMPA, a river in San Salvador, a division of Central America, rising in a valley of Guatemala, and flowing e.s.e.; is an outlet for lake Guijar, and making its way through a volcanic range of mountains, forms a part of the n. boundary of San Salvador, separating it from Honduras and dividing its e. section, empties into the Pacific ocean at San María, 210 m. from its source. It traverses the departments of Sonsonate and Cuscatlan forming the e. boundary of San Vicente and La Paz, and the w. boundary of San Miguel. It has broad valleys, with a productive alluvial soil, and for the most part well populated. Some portions are subject to a sudden rise of from 20 to 35 ft., which floods the adjacent country. It is navigable for a considerable distance from its mouth, which is obstructed by a bar, but is connected with the estuary of Jaltepeque by a narrow strait, about 3 m. in length, navigable for part of the year by small boats. It is the largest river on the Pacific coast of Central America.

LEMPRIERE, JOHN, D.D., b. in Jersey about 1760, was educated at Westminster school and Pembroke college, Oxford, and d. Feb. 1, 1824. His name was once well known to every classical student in the British empire, but the rising generation is forgetting it, and it will soon become *vox et præterea nihil*. Lemprière's *Classical Dictionary* (*Bibliotheca Classica*, 1788) was for many years the standard work of reference in England on all matters of ancient mythology, biography, and geography. To elderly scholars, the name will call up many pleasant memories of years long gone by; but the book itself ceased to possess any intrinsic value after the publication of the magnificent classical dictionaries edited by Dr. William Smith, 1842–53. Another work of Lemprière's was *Universal Biography* (Lond. 1808).

LEMUR, a genus of mammalia which gives its name to the family *lemuridæ*, a family allied to monkeys, and, like them, quadrumanous, having on each of the four extremities a well-developed thumb opposed to the fingers, but in other respects exhibiting an approach to the ordinary quadrupedal type. The general form is slender and elongated, the muzzle pointed, the eyes large, the ears very small, the hind limbs longer and larger than the fore limbs. The molar teeth are furnished with pointed tubercles fitting into each other, as in *insectivora*, and the whole dentition of many of the family is adapted to animal rather than vegetable food. All the *lemuridæ* are natives of the warm parts of the old world, and live chiefly in forests, most of them climbing trees with all the agility of monkeys. The name *lemur* (Lat. *lemur*, a ghost) is allusive to their rapid and peculiar noiseless movements. They are graceful and beautiful creatures, and generally gentle and easily tamed; but they have neither the prying and mischievous dispositions, nor the intelligence of monkeys. The species of the genus *lemur*, as now restricted, are all natives of Madagascar. They are gregarious, and their food consists partly of fruits. The names *maki* and *macaudo* are given to some of them, and sometimes extended to all. The largest species is about the size of a large cat. To the lemur family belong also the lorises, indris, galagos, and tarsiers.

LEMURES, the general designation given by the Romans to all spirits of departed persons, of whom the good were honored as *lares* (q.v.), and the bad (*larvæ*) were feared.

as ghosts or specters still are by the superstitious. Like the latter, they were said to wander about during the night, seeking for an opportunity of inflicting injury on the living. The festival called *leumuria* was held on May 9, 11, and 13, and was accompanied with ceremonies of washing hands, throwing black beans over the head, etc., and the pronunciation nine times of these words: "Begone, you specters of the house!" which deprived the lemures of their power to harm. Ovid describes the *leumuria* in the fifth book of his *Fasti*.

LEMU'RIA, a name given by certain geologists and anthropologists to a supposititious or lost continent. Such a continent, it is claimed, existed in a distant, yet not extremely remote geologic age. The position assigned it is in the Indian ocean, beneath the waters of which imagination sees it submerged; and attempts have even been made to define its bounds. The derivation of the name is from the Latin *lemur*, a specter, used by scientists to designate a genus of mammalia common in Madagascar and adjacent regions. The name was first bestowed by Sclater. The argument for the existence of such a land is mostly of an *a priori* kind, though some positive geological evidence exists. The belief is more especially accepted by some of the upholders of the monogenist theory of the propagation of the human species, as offering a plausible locality for the nativity of the first parents of mankind. Many otherwise difficult problems, both ethnological and geological, may be readily solved by taking for granted the existence of Lemuria. Thus, sir John Lubbock, in his *Prehistoric Times*, claims that the present position of the Negroid races of Africa is explicable only on the hypothesis that, since their first appearance, immense geographical changes have taken place; that there must have been a very large tract of land, or perhaps a great chain of islands, stretching from the e. coast of Africa across the Indian ocean, while that sea was then covering the great African deserts.

On the whole, while the former existence of extensive tracts of land in the region is extremely probable, it cannot as yet be accepted as proven, however convenient it might be as a universal depository of "missing links."

LEMURINÆ, a sub-family of *lemuridae* (q.v.), including the genera *lemur*, *hapalemur*, and *lepilemur*. They have woolly fur, long tails, and fox-like muzzles. There are many species, having a great variety of color and arrangement of fur, as the ruffed lemur and the white-ruffed lemur. They are very common animals in menageries, and do not pine in confinement. They are exclusively natives of Madagascar. The lepilemur is the only genus having a tail shorter than the body. When reposing, the members of this family roll themselves up into a ball, winding the tail around the body. They are great leapers.

LE'NA, an important river of Eastern Siberia, rises amid the mountains on the n.w. shore of lake Baikal, in the government of Irkutsk, flows first in a north-eastern direction to the town of Jakutsk, then n. to the Arctic ocean, into which it falls by several months. Its course is 3,000 m. in length, and its chief affluents are the Vilui on the left, and the Vitim, the Olekma, and the Aldan on the right. Navigation on the Lena is open from May till November. During spring, the waters of the river regularly overflow their banks. Near the town of Jakutsk, the breadth of the river is 6½ miles. Lena is the principal artery of the trade of Eastern Siberia. Russian and Chinese goods, as well as Siberian furs, furnished by the natives, are exported from this river. The chief harbors on the river are Olekmansk, Jakutsk, and Kachugsk, where £50,000 worth of goods from Irkutsk are shipped annually.

LEN'APES. See DELAWARE INDIANS.

LENAU, NIKOLAUS, 1802-50; b. Hungary; his family name was NIEMBSCH VON STREHLENAU; he was educated at the university of Vienna, and afterwards studied law and medicine. He visited the United States in 1832, and about the same time published in German a collection of lyric poetry which met with general public favor. In 1844, when about to be married, he became insane, and was placed in an asylum, where he remained until the period of his death. He wrote the drama of *Faust* (1835); two epic poems—*Savonarola* (1837) and *Die Albigenser* (1842); and a drama, *Don Juan* (1851), which was his favorite. His complete works were published in Stuttgart in 1855 and 1870.

LEN'AWEE, a co. in s. Michigan, having the state line of Ohio for its s. boundary; is drained by the head waters of the Raisin and Macon rivers, Bear creek, emptying into the Raisin, and Bean creek or Tiffin river, flowing over the border into Ohio; 720 sq.m.; pop. '80, 48,343. Its surface is rolling, and well timbered. Its soil is a dark, rich, sandy loam, productive of tobacco and dairy products. It produced in '70, 1,467,408 lbs. of butter and 11,983 lbs. of honey; other products are sorghum, maple-sugar, flax, hops, fruit, and every variety of grain. Value of all live stock in '70, \$2,897,101. Cash value of farms in '70, \$21,158,168, numbering 4,312. It had in '70, 585 manufacturing establishments, with a capital of \$2,226,831, and a product of \$4,265,925, including manufactories of agricultural implements, brick, cars, iron castings, machinery, cheese, cooperage, carriages; also, breweries, tanneries, currying establishments, and planing, flour and saw mills. It is intersected by the Chicago and Canada Southern railroad, the Lake Shore and Michigan Southern, and the Jackson and Monroe branches of the Lake Shore and Michigan Southern. Seat of justice, Adrian.

LEN'CAS, a tribe of Honduras Indians, numbering about 40,000, and occupying a range of table-lands near Comayagua, the capital of Honduras. They are a courageous, but perfectly peaceful tribe, hard-working and economical, and, like all mountaineers, passionately attached to their country. Their language appears to consist of dialects of a tongue which must once have been widespread through Central America and Mexico, and which is termed *Chontal*, meaning simply exotic or barbarous.

L'ENCLOS, NINON DE. See NINON DE LENCLOS, *ante*

LENCZI'ZA, an ancient Polish t., in the government of Kalisz, about 90 m. w.s.w. of the city of Warsaw. It contains the ruins of a castle of Kazimir II., erected in 1180. Pop. '67, 6,407, half of whom are Germans and Jews. Linen and woolen cloths and soap are manufactured.

L'ENFANT, PIERRE CHARLES, 1755-1825; b. France; came to America with Lafayette in 1777, and served in the revolutionary war as an officer of engineers. He was promoted to a captaincy in 1778, and wounded at the siege of Savannah; was afterwards made maj., and acted as engineer at fort Mifflin in 1794. He drew the plans for the city of Washington and for some of the public buildings there. In 1812 he declined an appointment as professor of engineering at West Point. Died in Maryland.

LENKORAN, a Russian seaport on the Caspian sea, and a district t. in the government of Baku, in the Caucasus, in lat. $38^{\circ} 46'$, is a place of great importance for the trade between Russia and Persia; but a defective harbor and the vicinity of warlike tribes have hitherto rendered its natural advantages of little avail. Pop. '67, 15,933.

LENNEP, a t. of Rhenish Prussia, 22 m. e.s.e. from Düsseldorf, in a beautiful valley on the Lennep, an affluent of the Rhine. It is a principal seat of the woolen manufacture, and the cotton manufacture is also carried on. Pop. '75, 7,782.

LENNEP, JAN DANIEL VAN, a Dutch philologist, was b. at Leeuwarden, in the province of Friesland, in 1724, and studied at Franeker and Leyden. In 1752 he was appointed professor of ancient languages at Groningen, and fifteen years afterwards at Franeker. He died in 1771. The works which principally obtained him a reputation for learning and acuteness are his *Etymologicum Linguae Græcae* and his *De Analogiâ Linguae Græcae*, both of which were posthumously published. The progress of etymological science, however, has rendered them useless.—DAVID JACOB VAN LENNEP, a member of the same family as the preceding, was b. at Amsterdam, July 15, 1774, devoted himself to the study of philology, and ultimately became professor of rhetoric at Leyden. He died Feb. 10, 1853. Besides being one of the best Latinists among his countrymen, he wrote several exquisite pieces of poetry in his mother-tongue. His principal writings are *Carmina Juvenilia* (Amst. 1791), *Exercitationes Juris* (Leyd. 1796), valuable annotated editions of some of the classic authors, and a metrical Dutch translation of the *Works and Days* of Hesiod (Amst. 1823).—His son, JACOB VAN LENNEP, b. at Amsterdam, Mar. 25, 1802, is proudly called by his countrymen the "Walter Scott of Holland." Educated for the law, he passed as a barrister, and soon achieved a great reputation for legal knowledge. Yet without neglecting his extensive practice, he for more than thirty years cultivated literature with untiring assiduity, and, considering the drudgery of his professional work, with astonishing success. Lennep first appeared as an author shortly before 1830, in a work entitled *Vaderlandsche Legenden* (National Legends). Since then his most popular works have been the comedies, *Het Dorp aan die Grenzen* (The Frontier Village, 1830), *Het Dorp over die Grenzen* (The Village over the Frontier, 1830), and the novels, *Onze Voorouders* (Our Forefathers), *De Roos van Dekama* (The Rose of Dekama, 1837—English by Woodley, 1847), and *De Pleegzoon* (The Adopted Son—English by Hoskins, New York, 1847). Lennep, who possessed a remarkable knowledge of the English language and literature, has translated into Dutch some of Shakespeare's finest plays, and of Byron, Southey, and Tennyson's poems. A complete edition of his dramatic works, comprising tragedies, comedies, and operas, appeared at Amsterdam in 1852-55. He was engaged for several years on an edition of the great Dutch poet Vondel. He died Aug. 25, 1868.

LENNOX, a co. in e. Ontario, Canada, having for its s.e. boundary the bay of Quinte, an estuary on the n. of Prince Edward's co., s.w. of the point where the St. Lawrence leaves the e. portion of lake Ontario; 315 sq.m.; pop. '71, 16,396. Its surface is drained by the Napanee and other small rivers, and is diversified by low hills, fertile valleys, plains, and well-timbered land. Its water-power is utilized by paper-mills and other factories, and its county seat is a port of entry. Its soil, founded on a sub-stratum of limestone, is very fertile, and every variety of grain is raised. It is intersected centrally by the Grand Trunk railway, crossing the river Napanee. The co. of Addington on the e. and Amherst island directly s. of, and belonging to, that co., are included in the same riding. Seat of justice, Napanee.

LENNOX, CHARLOTTE, 1720-1804; daughter of lieut.gov. Ramsay of New York. At the age of fifteen she went to London and devoted herself thenceforward to literary pursuits. She wrote novels, verses, pastorals, and several translations from the French. *The Female Quixote*, an imitation of *Don Quixote*, satirizing the French romances of the 17th c., had for a time a considerable vogue. It appeared in two volumes in 1752. Miss Lennox was on terms of intimacy with Richardson the novelist, and with Dr. Johnson; the latter wrote the dedication for her *Shakespeare Illustrated*.

LENNOX, WILLIAM PITT, Lord, b. 1799; fourth son of the fourth duke of Richmond, and godson of William Pitt. He was educated at Westminster, and having entered the army served for several years upon the staff of the duke of Wellington. He has been a voluminous contributor to magazines and newspapers. Among his works are: *Compton Audley*; *The Tuft-Hunter*; *Percy Hamilton*; *Philip Courtney*; *Merrie England*; *Recreations of a Sportsman*; *Fifty Years' Biographical Reminiscences*; *Adventures of a Man of Family*; and *Drafts on my Memory*.

LENNOX. See DUMBARTONSHIRE, *ante*.

LENNOX, Earls and Dukes of. See STEWART, THE FAMILY OF, *ante*.

LENNOXTOWN, a village of Stirlingshire, Scotland, is situated in a picturesque district on Glazert water, at the terminus of the Campsie railway, 11 m. n.n.e. of Glasgow. It contains, '71, 3,917 inhabitants, employed chiefly in the print-works and alum-works in the immediate neighborhood.

LENOCINIUM is a term borrowed from the canon law, and used in English, but more frequently in Scotch, law to denote a husband's connivance in his wife's adultery. The wife can set up such defense to a suit for divorce, on the ground of her adultery so procured.

LENOIR, a co. in s.e. North Carolina, drained by the navigable Neuse river emptying into Pamlico sound, and by the Trent rising in it and emptying into the estuary of the Neuse at Newbern; about 430 sq.m.; pop. '80, 15,344—15,328 of American birth, 8,067 colored. It has a level surface partially covered with pine and other evergreen trees. It has a sandy but fertile soil, producing rice, flax, sweet potatoes, tobacco, cotton, fruit, sorghum, and every variety of grain; cattle, sheep, and swine are raised. It produced in '70, 11,712 lbs. of honey. Cash value of farms in '70, \$731,917, numbering 641. It is intersected by the Atlantic and North Carolina railroad, Morehead City to Goldsboro'. Its manufactories include turpentine distilleries, flour and saw mills; and its county seat is a shipping place for thousands of bales of cotton annually. Seat of justice, Kinston.

LENOIR, WILLIAM, 1751-1839, b. Brunswick co., Va., but removed in childhood to North Carolina, where he took an active part in the campaigns against the British and the Tories. For 60 years he held the office of justice of the peace, served frequently in both branches of the legislature, for five years was president of the senate, then president of the council, and in the later years of his life maj. gen. of the state militia.

LENORMAND, MARIE ANNE ADELAIDE, 1772-1843; b. Alençon, of respectable but poor family, and for some time was a seamstress; in 1790 went to Paris, where she was a saleswoman in a linen shop; in 1793 entered into partnership with Mme. Gilbert and a baker's boy for carrying on fortune-telling. On complaint to the police she was arrested and imprisoned for several months. But this increased her popularity, and after her release she opened a "cabinet of divining," and for 40 years she was visited by people of all ranks, even by the court of Napoleon. The allied sovereigns who were assembled at Aix-la-Chapelle, especially the emperor Alexander, paid her great attention. In 1809 she was arrested on account of "indiscreet revelations," and again in 1821 for sentiments contained in a book called *La Sibylle au Congrès d'Aix la Chapelle*. She became rich, but died in obscurity. None of her publications were of importance except *Souvenirs de la Belgique*; *Cent Jours d'Informé*; and *Mémoires historique et secrets de l'impératrice Joséphine*.

LENORMANT, CHARLES, 1802-1859, b. Paris; studied law, but visiting Italy became specially interested in antiquities; was made inspector of fine arts in 1825; accompanied the younger Champollion to Egypt in 1828. Returning to Paris he held important positions in connection with art and archæology; was professor in the Sorbonne in 1835, but resigned on account of his ultramontane views. He was afterwards made professor of Egyptology in the college de France. He published *Des Artistes contemporains*, 2 vols.; *Élise des Monuments céramo-graphiques*, 4 vols.; *Trésor de Numismatique et de Glyptique*, 5 vols.; *Introduction à l'Histoire orientale*; *Musée des Antiquités Egyptiennes*; *Questions historiques*. He was a member of the commission for exploring the Morea, and was for some time editor of the *Correspondant* magazine.

LENORMANT, FRANÇOIS, son of Charles; b. Paris, 1835; educated by his father; made at an early age archæological and numismatic researches under the direction of his father; took in 1857 the numismatic prize awarded by the academy of inscriptions; made archæological tours in Germany, Italy, Egypt, Greece, and Turkey. The massacres of the Christians in Syria in 1860 occurring when he was there on an official mission, he sent an account of them in letters to the Paris newspapers, which were subsequently reprinted under the title of *Une Persécution du Christianisme en 1860; les derniers Événements de Syrie*. He made during that year important excavations at Eleusis; was sent in 1866 as a member of a scientific commission to observe the volcanic phenomena of the island of Santorin; was appointed professor of archæology in the *Bibliothèque Nationale*. He was a volunteer in the 9th regiment of the national guard of Paris during its siege, and was wounded at Buzenval. He attended the congress of orientalists in Florence in 1878; was editor of the *Moniteur des Architectes* 1869-72; and with M. de Witte founded the *Gazette Archéologique*. His contributions to antiquarian periodicals,

French and foreign, are very numerous. Some of his most important works are *Manuel d'Histoire Ancienne de l'Orient*; *Histoire des Peuples Orientaux et de l'Inde*; *Lettres Assyriologiques et épigraphiques*, 2 vols.; *Etudes Accadiennes*; *Les premières civilisations*.

LENOX, a t. in w. Massachusetts, incorporated in 1767, and named in honor of the duke of Richmond, is surrounded by beautiful scenery, has been the home of many prominent families of Massachusetts and New York, and the summer residence of their eminent citizens; pop. '80, 2,043. It is situated on a low range of the Berkshire hills, in the valley of the Housatonic river, 8 m. s. of Pittsfield, 33 m. s.e. of Albany, N.Y., 110 m. w. of Boston, and 125 m. from New York city. It has a station on the Housatonic railroad between Stockbridge and Pittsfield. It has 4 churches, an academy, excellent public schools, and a public library. It has manufactories of window and plate glass, lime, lumber, brick, flour, and iron-works. Its mineral products include iron ore and limestone, also marble of a superior quality, some of which has been used in the erection of government buildings in Washington.

LENOX, JAMES, 1800-80; b. New York; of good family, and in affluent circumstances, he received a liberal education, and thorough training for a moral and healthy life. His experiences were enlarged and his views broadened by extended foreign travel; and when he at last entered upon the long period of comparative retirement from public notice—which was his choice—it was with that propensity to “do good by stealth and blush to find it fame,” which ever thereafter characterized him. Among those who best knew him, he justly gained a reputation for unostentatious charity, wisely administered, as to which the general public was but little informed. And the endowment of the Presbyterian hospital in Fifth avenue, New York, and that of the Lenox library, magnificent gifts as they were, were not isolated instances as such, but only formed the crowning incidents of the administration of a thoroughly and persistently beneficent career. Mr. Lenox was a devoted bibliophile through life, and his bibliographical knowledge was, in certain directions, quite unequalled in his own country, and probably unsurpassed elsewhere. He formed a private library, which for its money value, as well as the rarity of many of its articles, was unrivaled, and of which the learned Dr. Cogswell, superintendent of the Astor library, remarked, that while it would have filled the space of only one of the 34 alcoves of that institution, in cost it exceeded that entire collection, at the time when the statement was made, which was in 1860. This library was fullest in bibles, early voyages and travels, early-printed American books, and *incunabula*. In the department of accounts of early voyages to America it was utterly without a rival. It contained the most perfect and finest copy of De Bry's Voyages known; the rare *Bay Psalm Book*; Eliot's Indian Bible; and the world-renowned Mazarin Bible, printed by Guttenberg, Faust, and Schaeffer, at Mayence, in 1455; the only perfect copy in America, and which cost Mr. Lenox, at auction, \$2,600. This superb collection was made the nucleus of the Lenox library, and, with the gallery of paintings bequeathed by their owner and collector for the same purpose, now exists in that institution, a gift to the city of New York. See LIBRARIES.

LENS (Lat. “a lentil”) is a circular section of any transparent substance, having its surfaces either both spherical, or one of them plane and the other spherical. As represented in Fig. 1, a ray of light in passing through a lens is bent towards its thickest part; hence lenses are either convex (thickest in middle) or concave (thickest at edges). The former make the rays more convergent (q.v.) than before, the latter make them more divergent. The point to which the rays converge, or from which they diverge, is called a focus—principal focus when the rays are parallel. The focus for a convex lens is real, i.e., the rays actually pass through it, and form an inverted image smaller or larger than the object according as the object is at a distance greater or less than twice the principal focal length; but the image is erect and magnified if the object be within the principal focal length. For a concave lens the focus is virtual—the rays seem to come from it and form an erect image smaller than the object.

The following is the mode of finding the principal focus when parallel rays fall on a double convex lens (Fig. 2): O is the center of the curved surface PAP', and O' of the surface PBP'; q is the point towards which the rays tend while passing through the lens, and F the point to which they converge after emergence. Let OA = r , O'B = s , Aq = f , and BF (the focal length) = f' ; then neglecting the thickness of the lens, which may be done when the curvature of the lens is small, Aq = Bq, and AF = BF. By the demonstration given under the article DIOPTRICS, we find $f' = \frac{\mu}{\mu - 1} r$, for the refraction at the first surface;

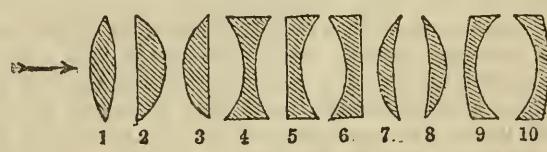

FIG. 1.—Lenses.

1, double-convex; if the surfaces are of equal curvature, equi-convex; 2, plano-convex; 3, convexo-plane; 4, double-concave, or concavo-concave; 5, plano-concave; 6, concavo-plane; 7, convexo-meniscus; 8, concave-meniscus; 9, convexo-concave; 10, concavo-convex. The arrow shows the direction in which the light is supposed to fall.

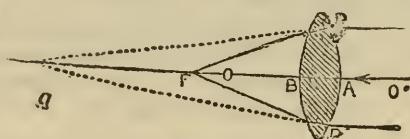

FIG. 2.

and, for the second surface, we find, in the ordinary treatises on optics, that when a pencil of converging rays emerges from a lens, $\frac{\mu}{f'} = \frac{\mu - 1}{s} - \frac{1}{f}$. Adding this formula to the former, we obtain $0 = (\mu - 1) \left(\frac{1}{r} + \frac{1}{s} \right) - \frac{1}{f}$, or $\frac{1}{f} = (\mu - 1) \left\{ \frac{1}{r} + \frac{1}{s} \right\}$; and if the lens be equi-convex ($r = s$), and of glass ($\mu = \frac{3}{2}$), we have $\frac{1}{f} = \frac{1}{r}$, or $f = r$. This result is equally correct for a double concave lens; but if the thickness of the lens be taken into account, there is a small quantity which is added to the value of $\frac{1}{f}$ in the convex, but subtractive in the concave lens. The determination of the principal focus in the other forms of lenses will be found in the ordinary text-books. The lenses in Fig. 1, though they may be of the same focal length, have peculiar properties which render them suitable for particular optical instruments; thus, the convexo-plane lens has only one-fourth of the aberration of a plano-convex, or two-thirds of an equi-convex or equiconcave of the same focal length; but, in general, the equi-convex is the most desirable form. Aberration* has been to opticians what refraction is to the astronomer, an unwelcome intruder, which spoils his finest theories, and limits the accuracy of his results. This aberration has, indeed, been destroyed by combining lenses of equal and opposite aberrations, as, for instance, uniting, by means of Canada balsam, a double convex with a double concave. A still better method would be the formation of lenses having one side spherical, and the other of an ellipsoidal or a hyperboloidal form; but this has not yet been successfully accomplished. Convex lenses of glass, rock-salt, ice, etc., may be used as "burning-glasses," since radiant heat is refracted according to the same laws as light—the hot focus being nearly coincident with the luminous one. Platinum, gold, etc., have been fused in three or four seconds by this means.

LENS (anc. *Elena* or *Lenense*), a t. of France, in the dep. of Pas-de-Calais, on the Souchez, a feeder of the Scheldt, 17 m. s.s.w. from Lille. It is a place of great antiquity, and was once strongly fortified. It is famous for the great victory gained by the prince of Condé over the Germans and Spaniards, under its walls, in 1648. In the neighborhood of Lens are coal-mines, lime-works, and brick-works. Pop. '76, 9,383.

LENT (Ang.-Sax. *lencten* = Ger. *lenz*, spring; Gr. *Tessaracoste*; Lat. *Quadragesima*), the fasting-time before Easter, which is observed in the Roman, and in the Greek, and other oriental churches. Under the head of FAST have been considered the doctrinal and historical questions connected with the general practice of fasting. It remains only to explain briefly what is peculiar in the institution and the observance of the Lenten fast. It is certainly of very ancient, if it be not even of primitive, institution. The earliest allusions to it speak of it as an established usage handed down from the fathers. The forty days' period, as commemorative of our Lord's forty days' fast, or of the similar penitential fasts of Moses and of Elias, commences with Ash-Wednesday, between which day and Easter-Sunday (omitting the Sundays on which the fast is not observed), forty clear days intervene. The rigor of the ancient observance, which excluded all flesh, and even the so-called "white meats," is now much relaxed; but the principle of permitting but one meal, with a slight refection or collation, is everywhere retained. In Spain, during the crusades and the wars with the Moors, a practice arose of permitting, in certain cases, the substitution of a contribution to the holy war for the observance of the Lenten abstinence; and although the object has long since ceased, the composition is still permitted, under the same title of the *Cruzada*. In the Greek church, the ante-paschal fast is of 48 days; but it is only one of four similar fasting periods observed in that church. See FAST. In the Anglican church, Lent is retained as a church season of the calendar, with special services, and proper collects and prayers; but the observance of the fast is left to the discretion of each individual.

LENT (ante). In the Acts of the Apostles it is recorded that, on some special occasions, fasting in connection with prayer was practiced both by apostles and churches. Once in the epistles it is recognized as at times helpful to the offering of special prayer. Beyond this, in the midst of many earnest practical exhortations to a holy life, no mention is made of fasting, nor is there any intimation that reliance was placed on it either as meritorious in itself or as a help to holiness. In the age immediately following that of the apostles, the practice, so far as it prevailed, seems to have been a continuance of Jewish or pagan observance rather than a Christian requirement. Very little reference appears to have been made to it by writers of the first century. In the 2d c., as Victor and Irenaeus say, it was the custom of several congregations to prepare themselves for Easter by mortification and fasting, commencing on the day in which they commemorated the crucifixion and continuing until the anniversary of the resurrection. This included a period of about 40 hours. By the time of the council of Nice (325 A.D.) it had been extended to 40 days, with the exception of the included Sundays, which were

* The directions which have been given for finding the foci of lenses, apply only to rays which pass through and near the center of the lens; the rays which pass near the edges converge to a different focus, and the distance between these two foci is called the longitudinal aberration.

never observed as fasts. Gregory the great, in 590, directed that the season should begin on the 6th Sunday before Easter, and that on all the intervening week days fasting should be practiced. Afterwards, either by him or Gregory II., four days of the preceding week, beginning with Ash-Wednesday, were added to make the whole fast 40 days. The council of Laodicea (held some time in the 4th c., but whether near the beginning, middle, or end is not now known) allowed only "dry food," that is, bread and water; and forbade the celebration of the festivals of martyrs, marriages, and birthdays during the whole of lent. Chrysostom, whose life extended from 347 to 407, says that "as many persons used to come to the communion thoughtlessly, especially at the time of the year when Christ first gave it to his disciples, our fore-fathers appointed 40 days for fasting, prayer, preaching, and holy assemblies; that all men being carefully purified by prayer, alms-deeds, fasting, watching, tears, and confession, might come with a pure conscience to the holy table." After a time fasting ceased to be a voluntary exercise. Laws enforcing it were passed in the 6th c. by the council of Orleans; in the 7th c. by the 8th council of Toledo; in the 8th c. the breach of its observance was punished with excommunication; in the 11th c. some persons who transgressed had their teeth drawn out. In later times such severities were greatly diminished. In England the observance was first made obligatory in the 7th c. by Ercombert, seventh king of Kent. Since the reformation lent has been retained in the calendar of the church of England, and has now a place in that of the Protestant Episcopal church in the United States, as a season for special religious services and instructions, in which the continuance and strictness of the fast is left to the judgment and choice of individual Christians. The six Sundays included in it are observed as festivals, never as fasts, and are therefore called Sundays *in* lent, not *of* lent. The last or passion week is naturally considered the most solemn portion of it, and is called "the great week." In nearly all Protestant churches on the continent of Europe—especially in the Lutheran—the lenten season is observed. The observance is regarded with more favor than formerly among non-episcopal denominations in the United States.

LENTAN'DO, in music, the same as *rallentando* or *ritardando*, meaning a gradual decrease in the speed of the movement.

LENTIBULARIA'CEÆ, a natural order of exogenous plants, allied to *primulaceæ*, but distinguished by an irregular corolla, and diandrous flowers. It has also intimate relations with *scrophulariaceæ*. It contains nearly 200 known species, all herbaceous, and all living in water or marshes. They abound chiefly in the tropics. A few species of bladderwort (q.v.) and butterwort (q.v.) are its only representatives in Britain.

LENTIL, *Ervum lens*, an annual plant of the same genus with tares (q.v.), a native of the countries near the Mediterranean, and which has been cultivated from the earliest times, yielding an esteemed kind of pulse. The English translation of the Bible is probably correct in calling the *red pottage* with which Jacob purchased Esau's birthright, *pottage of lentils*; the red color being very characteristic of this, which is still a very common article of food in the east. The lentil is extensively cultivated in the south of Europe, Egypt, and the east, and to some extent in other parts of the world. It has a weak and branching stem, from 6 to 18 in. high, and pinnate leaves with 6 to 8 pair of leaflets, the upper leaves only running into tendrils. The flowers are small, white, lilac, or pale blue, the corolla much concealed by the calyx, which is divided almost to its base into five narrow teeth. The pods are very short and blunt, thin, two-seeded, and smooth; the seeds have the form of a round lens, convex on both sides. There are numerous varieties, having white, brown, and black seeds, which also differ considerably in size, the greatest diameter of the largest being about equal to that of moderate-sized peas. Lentils are a very nutritive food, containing an uncommonly large amount of nitrogenous substances, and more easily digested than peas. They have recently become common in the shops of Britain in a form resembling *split peas*, and in that of meal (*L. farina*), which is the basis, if not the whole substance, of *revalenta arabica* and *ervalenta*, so much advertised as food for dyspeptic patients, at prices greatly exceeding those for which lentil meal can be obtained under its own name. Lentils mixed with peas in the making of pea-soup, greatly diminish its tendency to produce flatulence. Lentils are also excellent food for horses; and the herbage used as green food for cows, renders them extremely productive of milk. The lentil grows best in a light and rather dry soil. In a very rich soil, it produces comparatively few pods. Some of the varieties succeed well even on very poor soils. The whole life of the plant is shorter than that of any other of the *leguminosæ* cultivated in Britain. The seed may be sown in April in the climate of Britain; but although there is nothing in the coldness of the climate to prevent the successful cultivation of lentils, it seems to be too moist for them, the ripe or ripening seeds being very apt to be injured by moisture. There is no evident reason, however, why this plant should not be cultivated for green food of cattle.

LENTI'NI, a t. of Sicily, in the province of Siracusa, stands near the lake of the same name, on a hill 15 m. s.s.w. of Catania, and has 10,578 inhabitants. It has a large gunpowder mill, and derives a good revenue from the fishery in lake Lentini.

LEN'TO, or **LENTAMEN'TÉ**, in music, means slow, gentle. According to the best authorities, the movement implied by *lento* is quicker than *adagio*, or between it and *andante*.

LEN'TULUS, name of an ancient patrician family distinguished in Roman history, of which the most conspicuous was Publius Cornelius Lentulus Sura. He was *quaestor* and *praetor*, and in 71 B.C. became *consul*, but was expelled from the senate on account of his immoral life. He joined the conspiracy of Catiline, and became the leader of the conspirators after Catiline had left for Etruria in 63. Arrested by order of Cicero, then in the *consulship*, he was tried before a full senate, condemned to death, and strangled in the *Capitoline prison*, B.C. 63.

LENTULUS, EPISTLE OF, the title of a letter professing to describe the personal appearance of Christ as witnessed by the writer, who styles himself Publius Lentulus, president of the inhabitants of Jerusalem. Manuscript copies of it, differing considerably in their texts, are found in several libraries of England, France, Italy, and Germany. In substance it is as follows: "There has appeared in our time a man of great virtue named Christ Jesus, who is said by the people to be a prophet of truth, whom his disciples call the Son of God; he raises the dead and heals the sick. He is a man of lofty stature, graceful mien, and venerable countenance, inspiring in those who look on him both love and fear. His hair falls around him, blown by the wind, and is somewhat curly, carulean, and shining; it is parted in the middle, after the manner of the Nazarenes, his forehead is smooth and very calm, his face without wrinkle or blemish, and adorned with a moderate degree of color. His nose and mouth are entirely without fault; his beard, in color like his hair, is abundant and youthful, not long but forked; his eyes are bright and changeable in expression. In reproof he is terrible, in admonition, gentle; he is kind, blends cheerfulness with gravity, is never seen to laugh, but often to weep. Thus, tall in stature, having graceful hands and limbs, and grave in speech, he is in an uncommon degree self-controlled and worthy of admiration among the sons of men." In former centuries this letter was highly valued, and among Roman Catholics many still receive it as genuine. The general opinion of Protestant critics may be given in the words of Dr. Edward Robinson, who thus sums up his investigation of the subject: "In favor of its authenticity we have only the purport of the inscription. There is no external evidence whatever. Against its authenticity we have the great discrepancies and contradictions of the inscription; the fact that no such official person as Lentulus existed at the time and place specified, nor for many years before and after; the utter silence of history in respect to the existence of such a letter; the foreign and later idioms of its style; the contradiction between the contents of the epistle and established historical facts; and the probability of its having been produced at some time not earlier than the 11th century."

LENZ, JAKOB MICHAEL REINHOLD, 1750-92; b. Sesswegen, Livonia; studied at Königsberg; went to Strasburg in 1771 as tutor to some Russian nobles, where he met and became enamored with Goethe's Friedericke Brion of Sesenheim, who rejected his offer of marriage. In 1776 he associated with Goethe, Herder, and other literary men at Weimar, but subsequently became dissipated, then insane, and ended his days in misery.

LEO, the fifth sign of the zodiac (q.v.).

LE'O, the name of 13 among the popes of the Roman Catholic church, of whom the following call for particular notice.—**LEO I.**, surnamed "the great," who is held a saint of the Roman Catholic church, and is one of the most eminent of the Latin fathers, was born of a distinguished Etrurian family at Rome, about the end of the 4th century. Of his early life, little is known. On the death of Sixtus III. in 440, Leo was chosen as his successor. It is in his pontificate that the regular series of papal letters and decretals may be said to commence. Leo's letters, addressed to all parts of the church, exhibit prodigious activity and zeal, and are used by Roman controversialists as an evidence of the extent of the jurisdiction of the Roman see. In a council held at Rome in 449, he set aside the proceedings of the council of Ephesus, which had pronounced in favor of Eutyches (q.v.), summoned a new council at Chalcedon, in which his legates presided, and in which Leo's celebrated "dogmatical letter" was accepted "as the voice of Peter," and adopted as the authentic exposition of the orthodox doctrine on the person of Christ. The history of Leo's interposition with Attila in defense of the Roman city and people will be found under the head **ATTILA**; and his subsequent similar interposition with Genseric, if less dramatic in the incidents with which history or legend has invested it, was at least so far successful as to save the lives of the citizens, and the public and private buildings of the city of Rome. Leo died at Rome in 461. His works, the most important of which are his letters and sermons, were first printed in 1479, and afterwards by Quesnel (2 vols., Paris, 1675); but a much more complete and trustworthy edition is that of Cacciari (3 vols. fol., Rome, 1753-55), and of the brothers Ballerini (Venice, 1757).—The pontificate of **LEO III.** is chiefly noticeable as the epoch of the formal establishment of the empire of the west. He was a native of Rome, and was elected pope on the death of Adrian I. in 795. During the greater part of the 8th c. the popes, through the practical withdrawal of the eastern emperors, had exercised a

temporal supremacy in Rome, which was fully recognized by the gift of Pepin, and placed under the protectorate of the Frank sovereigns, who received the title of patrician. The pontificate of Leo, however, was a troubled one, and in 799 he was treated with much violence, and obliged to flee to Spoleto, whence he afterwards repaired to Paderborn, in order to hold a conference with Charlemagne. On his return to Rome he was received with much honor by the Romans, and the chiefs of the conspiracy against him were sentenced to banishment. In the following year (800), Charlemagne, having come to Rome, was solemnly crowned and saluted emperor by the pope, and the temporal sovereignty of the pope over the Roman city and state, under, however, the suzerainty of the emperor, was formally established. In 804 Leo visited Charlemagne at his court at Aix-la-Chapelle. With Charlemagne's successor, Louis le Débonnaire, Leo was embroiled in a dispute about the right of sovereign jurisdiction in Rome, which had not been brought to a conclusion when Leo died in 816.—LEO X., Giovanni de' Medici, the second son of the celebrated Lorenzo de' Medici, was born at Florence in Dec., 1475. From his cradle he was destined to the ecclesiastical career. His education was intrusted to the ablest scholars of the age; and through the influence of his father with the pope, Innocent VIII., he was created cardinal at the unprecedented age of 13 years, in 1488. In the expulsion of the Medici from Florence, after the death of Lorenzo, the young cardinal was included, and he used the occasion as an opportunity of foreign travel. He was employed as legate by Julius II.; and during the war with the French he was taken prisoner in the battle of Ravenna, but soon afterwards effected his escape. On the death of Julius II. in 1513, cardinal de' Medici was chosen pope at the early age of 37, under the name of Leo X. His first appointment of the two great scholars Bembo and Sadoletto as his secretaries was a pledge of the favor towards learning which was the characteristic of his pontificate; but he did not neglect the more material interests of the church and the Roman see. He brought to a successful conclusion the fifth council of the Lateran (see COUNCIL), and the schism which was threatened by the rival council of Pisa. He concluded a concordat with Francis I. of France, which continued to regulate the French church till the revolution. In the political relations of the Roman see he consolidated, and, in some degree, extended the re-conquests of his warlike predecessor, Julius II., although he also used his position and his influence for the aggrandizement of his family. His desertion of the alliance of Francis I. for that of his young rival, Charles V., although the subject of much criticism, was dictated by a sound consideration of the interests of Italy. But it is most of all as a patron of learning and art that the reputation of Leo has lived with posterity. Himself a scholar, he loved learning for its own sake; and his court was the meeting-point of all the scholars of Italy and the world. He founded a Greek college in Rome, and established a Greek press, which he endowed munificently (see LASCARIS). In the encouragement of art he was no less munificent. Painting, sculpture, architecture, were equally favored; and it is to his vast project for the rebuilding of St. Peter's, and to the step to which he had recourse for procuring the necessary funds—his permitting the preaching of an indulgence, one of the conditions of obtaining which was the contribution to this work—that the first rise of the reformation in Germany is ascribed. He himself seems to have regarded the movement as of little importance, describing it as “a squabble among the friars;” and though he condemned the propositions of Luther, and issued a commission to inquire into his doctrines, his measures, on the whole, were not marked by much severity. His personal habits were in keeping with his taste, splendid and munificent in the highest degree; but in his moral conduct he maintained a strict propriety, and his character, although not free from the stain of nepotism, the vice of that age, and more modeled on the ideal of an enlightened prince than on that of a zealous and ascetic churchman, was beyond all imputation of unworthiness or irregularity. His death, which occurred rather suddenly on Dec. 1, 1521, during the public rejoicings in Rome for the taking of Milan, was by some ascribed to poison, but there seems no solid reason for the suspicion. See Roscoe's *Life and Pontificate of Leo X.* (1805).

LEO I., FLAVIUS, emperor of the east, surnamed the great; d. 474; b. Thrace; having, by the influence of Aspar, who commanded the auxiliaries, ascended the throne at the close of the peaceful reign of Marcianus, A.D. 457, he was confirmed by the senate, and acknowledged emperor and chief of the military forces, receiving the crown from the hands of the bishop Anatolius, patriarch of Constantinople, who gave the proceedings the sacred sanction of a ceremony, which introduced at that time, has ever since been performed on the occasion of the elevation of a monarch to the throne. His birth was lowly, but urged by a lofty ambition, with persistent endeavor, aided by the interested exertion of the power of the Gothic chief, Aspar, he rose to high military rank, and at the time of the death of his predecessor was in command of a body of troops near Selymbria. Upon assuming the control of affairs he adopted the policy of Marcianus toward the Eutychians, who having recently put to death their bishop and placed another, Ælurus, in his place, were disturbing the peace of Alexandria, and inciting the populace against him. He exiled Ælurus, and appointing an orthodox bishop in his place, angered Aspar, who being an Arian, had approved and concealed the movements of the Eutychians. On this issue he quarreled with Aspar. Having defeated the Huns in a battle in the province of Dacia, in which a son of Attila was killed, with Anthemius,

emperor of the west, as an ally, he prepared a large fleet with which to convey a division of the army to make war against the Vandals, under Genseric, then in possession of Africa. He succeeded in taking the island of Sardinia and Tripolis, and other towns of Libya, but on attempting to leave the harbor of Carthage by night, he was attacked by fire ships, which setting fire to his fleet, caused the expedition to result in failure. He suspected Aspar and his father of intrigue with his commander Basiliscus that brought about these reverses. Their motives have been questioned by historians, ascribing to them a desire to rule the kingdom through him, Aspar's Arianism being an insuperable barrier to his assuming personal direction of the empire. Notwithstanding that he owed his advancement and his accession of the throne to them, he resolved to put Aspar to death, and having in A.D. 471 arranged the preliminaries of a marriage between his daughter and Patricola, Aspar's son, purposely exciting the indignation of the people whom he knew to be inimical to the family of Aspar, they rose in revolt against the union, and pursued Aspar and his son to the church of St. Eupheinia where they had taken refuge. He persuaded them to come to the royal palace for protection, and violating his royal oath beheaded them on their arrival. His capital was menaced for two years by the Goths, who, incited by Ricimer, constituted themselves the avengers of Aspar in the interest of the Arians; at the end of which time peace was declared. He died in 474, leaving a reputation for thoughtful vigilance and moderation in the conduct of his empire, for a desire to promote the well-being of his subjects, for wisdom in legislation, and economy in administration, bearing the odium of no failing but that of a culpable neglect of justice in allowing Aspar absolute freedom for so long, and of betraying him with perjury at last.

LEO (*ante*), II., SAINT, b. in Sicily, and became pope in 682, but died in the following year. He succeeded in healing the schism between the sees of Rome and Ravenna, through an arrangement by which the bishops of Ravenna were to be ordained at Rome, and to be exempted from the payment of the money fee previously exacted from them. He was the friend and patron of church music, and aided in the improvement of the Gregorian chant. He built a church to St. Paul, and is said to have been the originator of the custom of sprinkling with holy water.

IV., d. 855, a native of Rome, succeeded Sergius II. in 847. He built a new Roman suburb, occupying 4 years in the labor, and it was named in his honor *Civitas Leonina*. He also restored Porta, a town near the mouth of the Tiber, where he colonized several thousand Corsicans who had been driven from their own country by an inroad of Saracens. He also founded a new town which was called Leopolis, since destroyed. The fabulous pope Joan has been interpolated by certain writers between this pope and Benedict III., who succeeded him.

V. assumed the papal authority Oct. 28, 903, but was imprisoned and forced to abdicate by Christopher, cardinal-priest of St. Lorenzo, and his own chaplain. He is said to have died of grief in prison a little more than a month after his election.

VI., born in Rome, succeeded John X., 928, and died after occupying the papal chair during 7 months. It has been alleged that he was put to death by the celebrated and infamous Marozia.

VII., also a Roman, became pope in 936, and reigned until his death in 939. His character is said to have been excellent, but little or nothing is recorded concerning his life.

VIII., succeeded John XII., who had been deposed, but who afterwards put Leo to flight and resumed the papacy. John was put to death, for cause; Benedict V. was elected by the Romans to fill the vacancy; and he, in turn, was removed by the emperor, Otho I., who reinstated Leo. The latter died about 965, and was succeeded by John XIII.

IX., BRUNO, was b. in Alsace in 1002, d. 1054. He was bishop of Toul, and was elected to the papacy in 1049. He was a man of great erudition, and did much to reform the discipline and morals of the clergy. Having led a grand military movement against the Normans, he was taken prisoner and detained by them in confinement for more than a year, the greatest respect being observed in his treatment. A number of important councils were held during his reign.

XI., ALLESSANDRO DE MEDICI, 1535-1605, b. Florence; was bishop of Pistoia in 1573, archbishop of Florence in 1574, and cardinal in 1583, in which capacity he was delegated to receive Henry IV. into the bosom of the Roman Catholic church. He was elected pope in 1605, and lived only 26 days thereafter.

XII., ANNIBALE DELLA GENGA, 1760-1829; b. Spoleto; archbishop of Tyre in 1793, and cardinal in 1816; was elected pope in 1823, on the death of Pius VII. He vigorously antagonized the Carbonari and other secret societies, and opposed Bible societies in a circular letter. He reorganized the university of the Sapienza in Rome, and reformed the administration of the papal state. He was succeeded by Pius VIII.

LEO III., FLAVIUS, surnamed "the Isaurian" (from his birthplace), emperor of Constantinople (718-741 A.D.), was, like most of the eastern emperors, first a soldier in the imperial army, and soon rose to eminence through his military talents. Anastasius II. appointed him to guard the Asiatic portion of the empire from the ravages of the Arabs, but on the deposition of the former by Theodosius III., Leo overthrew the usurper, and

assumed the crown (Mar., 718). He was scarcely seated on the imperial throne, when the caliph Suleiman laid siege to Constantinople by land and sea; this, the third siege of the capital by the Arabs, lasted for two years, but was finally raised through the energy of Leo. The governors of several provinces had meantime rebelled, and it cost Leo several years of petty warfare before peace was restored to the empire. Leo now issued an edict condemning the worship of images in the Catholic churches throughout the empire. The edict produced a most startling effect; rebellions broke out in all quarters, and Ravenna, Rome, and the other Greek possessions in Italy were finally severed from the empire. Leo, enraged at his losses, determined to take revenge on their author, the pope, and accordingly removed Greece, Illyria, and Macedonia from his spiritual jurisdiction, subjecting them to the patriarch of Constantinople, thus creating a permanent breach between the Latin and Greek churches (734). During the remainder of his reign little of importance occurred, excepting an indecisive war with the Arabs, and a great earthquake (Oct., 740), which caused dreadful calamities throughout the empire. Leo died June 18, 741.

LEO V., FLAVIUS, emperor of the east, surnamed the Armenian; d. 820; b. Armenia; rose to the rank of gen., but under the accusation of treason made by the emperor Nicephorus, he was imprisoned in a convent, until Michael Rhangabe coming into power in 811, released him and restored him to his command. In 813, having executed a successful campaign against the Saracens, he set out on an expedition against the Bulgarians, Michael being in chief command, but in the engagement allowed his own army to suffer defeat at Adrianople. Perceiving a way to reach the throne himself by profiting by the falling fortunes of his superior, he instigated a rebellion, in the remnant of the army, against his former benefactor, and marching at their head was elected emperor in his place. Receiving the imperial scepter sent by the unresisting hand of the deposed monarch, who retired into a convent, he was crowned at St. Sophia by the patriarch Nicephorus. He was an iconoclastic prince of the most pronounced type, and caused, so far as he was able, the adoration of images to be abolished by the second synod of Constantinople in 815, and condemned to punishment those who persisted in it, with Theodore Studita at their head; exiling the patriarch Nicephorus for the same cause. The weight of public sentiment was against him; his frequent changes in religious belief gaining for him the nickname of chameleon. In 814 he defeated the Bulgarians at Messembria. He arrested Michael, surnamed the stammerer, whom he suspected of treason, notwithstanding his former valuable services, and condemned him to death; but on Christmas morning in 820, while he knelt in the chapel of his palace, he was murdered by the adherents of Michael disguised as priests. Nicephorus, then in exile, exclaimed, "The church is freed from an enemy, but the state has lost an able prince." His reign is chiefly remarkable for the strict military discipline which was by him infused into the administration of the civil government.

LEO VI., FLAVIUS, Emperor of the Byzantine empire, b. 865; son of Basil I., whom he succeeded. His reign was marked by a succession of blunders and stupidities. His *Oracula* is a poem in iambic verse, in which he prophesied the fate of the empire. Several editions of it are extant. His *Orationes*, thirty-three in number, are mostly upon theological subjects. Of these there is no collected edition, but some of them have been preserved in Baronius's *Annales*, and others in *Bibliotheca Patrum*, etc. His most important work, however, is a treatise on military affairs, made up chiefly of extracts from other authors. Many editions of this are in existence, and among them an English translation by John Cheke (1554), and one in French by Joly de Mezeray (1774).

LEO XIII., the present head of the Roman Catholic church, was elected to the pontifical chair, Feb. 20, 1878. Descended from an old patrician family, Gioacchino Pecci was b. Mar. 2, 1810, at Carpineto, a village in central Italy. He studied at the Collegio Romano, graduated in law and theology, and becoming a favorite with pope Gregory XVI., was named by him a prelate of the household. As delegate successively at Benevento, Spoleto, and Perugia, he displayed great energy in the government of these provinces, and was especially vigorous and successful in the work of suppressing brigandage. Though but 33 years of age, he was in 1843 made archbishop of Dalmatia, and sent to Brussels as papal nuncio. In 1846 Gregory selected Pecci for the dignity of cardinal, but his friendly views in favor of the young archbishop were frustrated by death, and it was not till 1853 that Gregory's successor, Pius IX., saw fit to confer the cardinal's hat. Cardinal Pecci was no favorite of the all-powerful cardinal Antonelli, and was accordingly not prominent in papal councils. But in 1877 he was made Camerlengo (papal finance minister), and was chosen to be the successor of Pius IX. in the pontificate in 1878.

LEO XIII. (*ante*). The conclave of cardinals convened Feb. 18, 1878; and on the 20th, cardinal Pecci, archbishop of Perugia, received 45 votes, and was declared pope, assuming the above name. He at once made known the fact of his election to the great powers, and the first act of his pontificate was to restore the Roman Catholic hierarchy to Scotland, which was done on Mar. 4, 1878, by letter apostolic. The episcopal sees of St. Andrews and Glasgow were restored, and those of Aberdeen, Argyll, Dunkeld, the Isles, and Whithorn or Galloway, were created. Pope Leo appointed cardinal Franchi secretary of state and master of the sacred palaces; cardinal Simeoni secretary of the

Propaganda; cardinal Sacconi prodatary; and cardinal Morochini chamberlain. He issued his first encyclical letter in April, in which he specifically set forth a long catalogue of the evils afflicting human society—crimes, errors, and misdemeanors; attributing all of these to the departure of those concerned in them from the Roman Catholic church. Describing the present age as being “in bitter antagonism to religion and the church of Christ,” he proceeded to attribute to the papal authority all that had ever been of good, precedent to this miserable condition, asserting that it was the glory of the popes “that they ever stood as a wall and a bulwark to prevent human society from sinking back again into its former barbarism and superstition.” The encyclical continued by claiming temporal authority as the prerogative of the papacy, and urging the faithful to persevere and persist in asserting and sustaining the claim. He demanded that education should be made “conformable in science and discipline to the Catholic faith;” attacked the custom of civil marriages; recommended the encouragement of “those associations which have principally been established of late years to the great advantage of Catholic interests;” and closed with a testimonial to the united condition of the church as against its enemies. The new pope continued to hold the antagonistic attitude sustained by his predecessor against king Humbert of Italy, and declared the governmental prohibition of religious instruction in the Italian schools to be a “very reprehensible measure.” On the death of cardinal Franchi, he appointed cardinal Nina to the position which had been held by the former. On July 20, 1878, under the direction of the pope, the congregation of the propaganda issued “Instructions,” directing the introduction of the canon law into the Roman Catholic church in the United States that country having hitherto been regarded as a missionary field. In 1879 the pope issued an encyclical letter aimed at the doctrines of the Socialists, Communists, and Nihilists; which was, by order of the czar, read in all the Roman Catholic churches in Russia. By his reception on Feb. 22 of a large number of Catholic journalists, the pope recognized the power of the press. During this year, the twenty-fifth anniversary of the definition of the Immaculate Conception was celebrated with pomp, the pope issuing an encyclical on the occasion. In all things the pope has thus far patterned his conduct and his opinions after those of Pius IX., and had sustained at their highest altitude the claims of the church concerning its authority and prerogative. Since this time, however, as is claimed by acute observers, there are signs of a far more comprehensive grasp and larger liberality than were intellectually possible to his sincere and estimable predecessor. The present pontifical administration seems aiming successfully at the unification of the opposing principles and tendencies which undeniably exist in the great church; and while upholding in full vigor the official demands of the Roman see, to seek application of the ancient principles in a spirit not unfriendly to the governing forces of modern Christendom. It is probable that the time has not yet come for a just estimate of this pontificate; while there has appeared sufficient reason for ascribing to the pope high intellectual and administrative ability, and personal moral excellence.

LEO, HEINRICH, b. at Rudolstadt, Germany, 1799. He resolved at first upon the study of medicine, but, under the influence of Turnvater Jahn, turned his attention to history, and took an active part with the students at Jena and Göttingen in the agitations of the period. Breaking away from these surroundings, he went to Italy under the patronage of the princess of Rudolstadt, and on his return avowed himself an enthusiastic admirer of Hegel. In 1828 he became professor in history at the university in Halle, and during the next few years wrote several works, in which he followed more or less closely the philosophy of his great master. Subsequently, however, he changed his position, adopting Hengstenberg as his leader, and attacking energetically the ideas of Hegel. Under the influence of this reactionary tendency he wrote several works.

LEO, LEONARDO, 1694–1756; b. Naples; studied music in Rome under the celebrated composer, G. O. Pitoni. Returning to Naples, he was made chapel-master of the church of Santa Maria Solitaria, and afterwards master of the conservatory La Pietà and the conservatory of Sant’ Onofrio. Besides his labors as a teacher, he composed voluminously for the church and for the stage, his music being highly commended by so excellent an authority as Dr. Burney. A difference of opinion exists among the authorities as to the date of his death, the date here given having been found inscribed on a portrait of the composer, preserved in the royal college of music in Naples, while other sources give it as 1742, 1745, and 1755.

LEO OF THESSALONICA, surnamed the philosopher. He was a learned ecclesiastic of the 9th c., but the date and place of his birth are unknown; studied grammar and poetry at Constantinople, and arithmetic, rhetoric, and philosophy under Michael Psellus in the island of Andros, and at the monasteries in continental Greece. He was a teacher at Constantinople, was appointed by the emperor Theophilus public teacher or professor, and soon afterwards the patriarch Joannes, a kinsman of Leo, by order of the emperor, consecrated him bishop of Thessalonica. On the death of the emperor he was deposed from his see, but was subsequently placed at the head of a mathematical school established by Caesar Bardas at the palace of Maynaura in Constantinople. Leo was still living in 869. Some astrological MSS. ascribed to him are found in European libraries.

LEO AFRICA'NUS, or **AL HASSAN IBN MOHAMMED**, about 1485–1562; b. in Grenada, Spain. He was of Moorish descent, and his parents emigrated to Morocco after the capture of Grenada by the Spaniards. At 16 years of age he went with an uncle on an embassy to Timbuctoo, and afterwards traveled in northern and central Africa, penetrating to Nubia, descending the Nile, and extending his explorations into Persia. While returning from Constantinople by sea in 1517 he was captured by pirates and taken to Rome, where he was converted to Christianity and patronized by pope Leo X., whose name he adopted. He learned the Latin and Italian languages and taught Arabic. Died at Tunis. His *Description of Africa*, written in Arabic, was published in Italian by Ramusio in 1550, and, more than 80 years later, in Latin by Elzevir.

LEO'BEN, a t. of Austria in Styria, 9 m. s.w. of Brück, on the Mur, 1650 ft. above the sea-level, and at the junction of the Vienna and Trieste railway; pop. 4,529. It is well built, surrounded by a wall with three gates, has extensive barracks and several elegant public buildings. The inhabitants are employed mostly in mining and forging iron; and some trade is carried on in coal, iron, and salt. Here was concluded, April 18, 1797, a preliminary treaty between Austria and the French republic, followed by the peace of Campo Formio.

LEOCII'ARES, an Athenian sculptor mentioned by Pliny as living b.c. 372. In b.c. 352, he was one of those employed to erect the famous tomb in honor of Mausolus, king of Caria. He also was engaged with other artists by Philip in commemorating his victory at Chaeronea b.c. 338, and produced his portrait-statues of Philip, Alexander, Amyntas, Olympias, and Eurydice. His masterpiece was the "Rape of Ganymede by the Bird of Jove," a bronze statue much admired in its time, of which a marble copy is now in the *Museo-Pio-Clementino* at Rome. His statue of "Jupiter Tonans" is characterized by Pliny as "*ante cuneta laudabilem*."

LEOBSCHÜTZ, a t. in the s. of Prussia, in Silesia, near the river Zinna, has large corn and flax markets. Pop. '75, 11,425.

LEOM'INSTER, a t. in central Massachusetts, much visited in the summer season on account of its delightful surroundings, and its convenient distance from Wachusett mountain; pop. '80, 5,776. It is situated on the e. and w. banks of the Nashua river, and each village has a railway station, Leominster Center on the Boston, Clinton, Fitchburg and New Bedford railroad, and North Leominster on the Fitchburg railroad. It is 54 m. n.w. of Boston and 5 m. s.e. of Fitchburg. It is well built, and has excellent public schools, a national bank, a savings bank, 6 churches, 1 newspaper, gas-works, water-works, a public library, and 2 hotels. Its leading industries are the manufacture of combs, pianos, paper, children's carriages, furniture, toys, linen and woolen goods.

LEOMINSTER, a market t. and municipal and parliamentary borough of England, in the co. of Hereford, situated 12 m. n. of the city of that name, on the river Lug. It returns one member to parliament. The immediate vicinity of Leominster is one of the most celebrated cattle-breeding districts in the world. Pop. '71, 5,863.

LEON, formerly a kingdom, and subsequently a province of Spain, now subdivided into the smaller provinces of Salamanca, Zamora, and Leon, is situated in the n.w. of Spain, s. of Asturias, and bordering on Portugal. Area about 15,000 sq. miles. Pop. '70, 881,930 (of modern province, 350,092). The country, which is intersected by the Douro, is mountainous, generally fertile, but miserably cultivated. It affords pastureage to vast flocks of merino sheep. The inhabitants are for the most part uneducated and lazy, but are very high-spirited, rich in peculiar customs, of pure Spanish descent, sincere, hospitable, and brave. It is said that in the high districts s. of Salamanca, remnants of the pure Gothic tribes exist, and at Astorga, remnants of the old Celiberi—the *Maragatos*. The means of communication are everywhere very defective. The kingdom of Leon was erected, in 746, by Alfonso the Catholic out of the provinces he had wrested from the Saracens and the older kingdom of Asturias, and in 1230 it was permanently united to Castile.

LEON, a co. in n. Florida, having for its n. boundary the state line of Georgia, and for its w. the Ocklockonnee river, emptying into Appalachee bay and thence into the gulf of Mexico; also, has lakes of considerable size in the northern section; 800 sq.m.; pop. '80, 19,660—19,573 of American birth, 16,843 colored. Its surface is uneven, rising into hills in the n. section, and in the s. spreading out into broad plains. It is well timbered, and the soil is adapted to the raising of tobacco, cotton, rice, wool, oats, corn, sweet potatoes, sugar cane, and live stock. Cash value of farms in '70, \$1,225,418. It had in '70, 30 manufacturing establishments, employing 187 hands, with a capital of \$318,300, and product of \$256,310. It is intersected by branches of the Jacksonville, Pensacola and Mobile railroad, forming a junction at Tallahassee. Seat of justice, Tallahassee, the capital of the state.

LEON, a co. in e. Texas, having the Trinity river for its e. boundary, emptying into Galveston bay, is drained by that river and the head-waters of the Navasota river, which forms its w. boundary; 800 sq.m.; pop. '80, 12,818—12,729 of American birth, 5,110 colored. Its surface is hilly and heavily timbered. Its soil, a rich black loam, is very fertile along the water-courses and adapted to the raising of live stock, tobacco, cotton, sweet potatoes, and sorghum. In '70, it produced 12,291 lbs. of honey. It is

traversed by the International and Great Northern railroad, crossing it diagonally. Seat of justice, Centreville.

LEON (the *Legio septima gemina* of the Romans), capital of the former Spanish province of the same name, is situated between the rivers Bernesga and Torio, in a beautifully wooded plain, 85 m. n.w. of Valladolid. Part of the old Roman wall, 20 ft. thick, is still standing. The streets are crooked and dirty, but the churches are both numerous and splendid, especially the cathedral, a specimen of the purest Gothic, containing the tombs of many sovereigns of Leon, saints, and martyrs. The trade of Leon is now unimportant. Pop. 5,720.

LE'ON, a city of Mexico in the state of Guanajuato, capital of a district of the same name, on the Rio Torbio, 100 m. n.w. of Mexico; pop. 78,930. It is well built, and is about 6,000 ft. above the sea. In a large and beautiful square are several fine public buildings, among which are the governor's palace, the parish church, and a picturesque arcade. The city has several churches, three convents, a hospital, and schools. It is one of the most flourishing cities of Mexico, has an extensive commerce in wheat and other grains, and manufactures leather, saddlery, cottons, and woolens. It was founded in 1576, but became commercially important only about 1855. It is now the chief entrepot of the Bagio or the plain of Guanajuato, celebrated for its thriving agriculture.

LEON, a city of Nicaragua, near the n.w. extremity of the lake of its own name, distant about 10 m. from the Pacific ocean, is finely situated in a most picturesque district, and contains a cathedral, a noble edifice, and a university. Pop. about 25,000.—The lake, also called Managua, measures 35 m. by 15. It derives considerable importance from its being an essential part of perhaps the most promising route across Central America between the Atlantic and the Pacific. See NICARAGUA LAKE.

LEON, PONCE DE. See PONCE DE LEON, *ante*.

LEONARD, DANIEL, 1740-1829; b. at Norton, Mass.; graduated at Harvard in 1760; studied law, and attained to eminence in the profession; was often elected to the legislature. In the discussions preceding the revolution he was a stanch whig, but when the war broke out he espoused the royal cause, sacrificing in consequence a considerable estate. His defense of the English government, written in reply to the arguments of John Adams against the colonial measures of lord North, displayed great ability. Mr. Adams reprinted the controversy in 1819, with a preface by himself. Leonard retired from Boston with the British forces in 1776, resided some time in London, and was afterwards for many years chief-justice of Bermuda. Died in London.

LEONARD, JAMES, about 1618-91; b. England; settled in Taunton, Mass., in 1652, and established there the first iron-works in the American colonies. Died in Taunton.

LEONARDO DA PISA, **LEONARDO BONAC'CI**, or **BONACCIO**; b. Italy; lived at the beginning of the 13th century. He was placed by his father with a master, who taught him the Arabic system of arithmetic, and to this science he devoted most of his life. He traveled in Syria, Egypt, and Greece to learn the different systems of arithmetic, decided that the Arabic was superior to all others, and did much to extend the knowledge of it in Europe. He is said to have introduced algebra into Europe. He wrote a work on algebra which was never printed, but is preserved at Rome, and is described in Cossali's *History of Algebra*. He was the author of a treatise entitled *Practica Geographia*, now in the Magliabecchi library at Florence, but his principal work was *Liber Abaci*, using the word abacus, which is an instrument employed to facilitate computation, to denote arithmetic in general. This was written in 1202, and published at Rome in 1857 by B. Boncompagni. He gained great celebrity.

LEONARDO DA VINCI. This great genius, whose works in painting are classed with those of Raphael and Michael Angelo, was also a sculptor, architect, and engineer, and he cultivated successfully anatomy, botany, mathematics, astronomy, poetry, and music. He was born, in 1452, at Vinci, in the Val d'Arno, near Florence; his father, Pietro da Vinci, notary to the signiory of Florence, placed him in good time with Andrea Verrocchio, who was an able sculptor, and a good painter; but in painting, his pupil soon surpassed him. In 1483 he went to Milan, and the duke Lodovico il Moro conferred on him an annual pension of 500 dollars. Besides performing various services for the duke, particularly as an engineer, he instituted an academy of arts in 1485. This academy, of which he was named director, was attended by many eminent artists, and influenced most beneficially the Lombard school of painting. It was in 1497, when 45 years of age, that he executed his famous picture, "The Last Supper," which was painted in oil on the wall in the refectory of the Dominican convent of Santa-Maria-delle-Gracie. He remained in Milan till 1500, when, on its occupation by the French, he returned to Florence, and in 1502 was appointed architect and chief engineer to Cesare Borgia, capt.gen. of the pope's army. In 1503 he was employed by Soderini Gonfaloniere of Florence to paint one end of the council-hall of the Palazzo Vecchio. For this Leonardo only completed the celebrated cartoon called the "Battle of the Standard;" another cartoon for a painting in the same apartment, the equally celebrated design called the "Cartoon of Pisa," having been executed at the same time by Michael Angelo. He returned to Milan in 1506. In 1513 he visited Rome in the train of Giuliano de' Medici, who went there to assist at the coronation of his brother, Leo X.; and in 1515 accompanied Francis I.

to Bologna, where he signed the concordat with Leo X. On the pressing invitation of Francis, he accompanied that monarch to France in 1516, along with his pupils Salai and Melzi. In bad health during the whole period he was in France, he executed no paintings there, being chiefly occupied in engineering. His death occurred at Amboise, May 2, 1519. The genius of Leonardo was universal: painting was not his sole occupation. He imparted to his works certain qualities of the highest kind, for his drawing evinces very great delicacy and elevation of style, not modeled on the antique, but formed on a profound knowledge of nature; and in his treatment of light and shadow he infused a degree of power, combined with softness, into his productions that invests them with a peculiar charm; while the influence of his style has operated powerfully on the schools of Milan and Parma. Leonardo's treatise on painting, *Trattato della Pittura*, has been published in several languages. The principal edition is that published at Paris, in folio, by Du Fresne, illustrated with drawings by Nicolas Poussin; the best, as regards the text, was published at Rome in 1817. Mr. Hallam says, in his *Introduction to the Literature of Europe*: "Leonardo's greatest literary distinction is derived from those short fragments of his unpublished writings that appeared not many years since, and which, according, at least, to our common estimate of the age in which he lived, are more like revelations of physical truths vouchsafed to a single mind, than the superstructure of its reasoning upon any established basis. The discoveries which made Galileo and Kepler and Maestlin and Maurolicus and Castelli, and other names illustrious, the system of Copernicus, the very theories of recent geologists, are anticipated by Da Vinci, within the compass of a few pages, not, perhaps, in the most precise language or on the most conclusive reasoning, but so as to strike us with something like the awe of preternatural knowledge." These things were published by Venturi (Paris, 1797), entitled: *Essai sur les Ouvrages Physico-Mathématiques de Léonard da Vinci, avec des Fragmens tirés des Manuscrits apportés de l'Italie*. The MSS. were afterwards returned to Milan. See *Leonardo da Vinci and his Works, with Life*, by Mrs. C. Heaton (London, 1874).

LEONFORTE, a Sicilian t. in the province of Messina, situated in a mountainous neighborhood, on the shore of the Mediterranean. It is surrounded by walls, and has a pop. of 11,523 inhabitants. There is a thriving trade in oil, wine, and grain.

LE'ONHARDT, GERHARD ADOLPH WILHELM, b. at Neuhaus, Hanover, 1815; educated in jurisprudence at Göttingen and Berlin, entered the service of the Hanoverian government in 1837, and became minister of justice in 1865. For 15 years he was president of the committee of examination in jurisprudence. After the annexation of Hanover to the German empire he was first made president of the court of appeal at Celle, and afterwards chief-justice of the new provinces. Then the king gave him a seat in the Prussian house of lords, and shortly afterwards he received the appointment of Prussian minister of justice. He has done much to improve the criminal code of Germany.

LEONIDAS I., son of Anaxandrides, king of Sparta, succeeded his half-brother, Cleomenes I., about 491 B.C. When the Persian monarch Xerxes approached with an immense army, Leonidas opposed him at the narrow pass of Thermopylæ (480 B.C.) with a force of 300 Spartans, and rather more than 5,000 auxiliaries. The Persians attempted in vain to win over Leonidas by the promise of making him ruler of the whole of Greece; and when Xerxes sent a herald calling the Greeks to lay down their arms, the Spartan answered: "Let him come and take them." The treachery of one Ephialtes having made it impossible to bar any longer the progress of the foe, Leonidas and his little band threw themselves on the swarming myriads, and found a heroic death.

LEONINE CITY. See *ROME, ante*.

LEONINE VERSES, the name given to the hexameter and pentameter verses, common in the middle ages, which rhymed at the middle and end. They were so named after Leoninus, a canon of the church of St. Victor, in Paris, about the middle of the 12th c., or, as others say, after pope Leo II., who was a lover and improver of music. Traces of this kind of versification appear here and there in the Roman poets, especially in Ovid, in some of whose epistles, indeed, they are as common on an average as once in every eight lines. Camden gives some curious specimens from Walter de Mapes, Michael, the Cornish poet, and Dan Elingham, a monk of Linton. The story of the Jew who, having fallen into a refuse-pit on Saturday, would not be helped out, because it was *his* Sabbath, while the Christian, who offered him assistance, refused to do so *next* day, because it was *his*, has been thrown into Leonine verse as follows:

Tende manus *Salomon*, ego te de stercore tollam;
Sabbata nostra *colo*, de stercore surgere *nolo*.
Sabbata nostra *quidem* *Salomon* celebrabis *ibidem*.

Leonine verse is not uncommon in English poetry, e.g.:

Arethusa arose from her couch of snows
In the Acroceraunian mountains,
From peak and from crag, with many a jag,
Shepherding her bright fountains.

LEON, ISLA DE, a long narrow island on the s.w. coast of Spain, province of Cadiz, in the Atlantic, separated from the main-land by a narrow deep channel, called

Santi Petri; is 10 m. long and 2 broad. The broadest part is next the main-land. On it are the cities of Cadiz, Isla de Leon, and San Carlos. The surface of the island is flat, and covered with saline marshes, from which the inhabitants obtain large quantities of salt. An ancient bridge across the Santi Petri connects the island with the continent.

LEONOWENS, ANNA HARRIETTE CRAWFORD, b. at Caernarvon, Wales, Nov. 5, 1834. Her father, Thomas Maxwell, while acting as aid-de-camp to sir J. Macnaughton, was killed by the Sikhs on the frontiers of Lahore. She married an English officer in India, Thomas Leonowens, who died in that country, leaving her with two children dependent upon her for support. By recommendation of the British consul at Singapore, she was appointed governess in the family of the late first king of Siam, who, having himself been taught English by American missionaries, desired his children to be educated in that language. She held this position for four years, 1863-67, acting at the same time as secretary to the king in his extensive English correspondence. She acquired much influence over the monarch as a mediator in behalf of the victims of arbitrary oppression, and carefully trained his son and successor, who, on coming to the throne in 1868, abolished slavery throughout his dominions. On retiring from her post in 1867 she came to America, and took up her residence in New York. She has published 2 vols., *The English Governess at the Court of Siam*, and *The Romance of the Harem*.

LEONTIUS, or LEO PILATUS, b. either in Thessalonica or Calabria, at a date unknown; came to Florence in 1360, and was employed by the republic at the request of Boccaceio as a teacher of Greek. He made the first translation of Homer into Latin, and was the first to lecture in public upon the great poet in western Europe. He went to Venice, where he met Petrarch, a pupil of Barlaam. From Venice he went to Constantinople, intending to return to Italy, but died on the voyage across the Adriatic. He furnished Boccaccio with the materials for his treatise on the genealogy of the heathen gods.

LEOPARD, *Felis leopardus*, one of the larger *felidae* (q.v.), now generally supposed to be identical with the panther (*F. pardus*), although by some they are regarded as varieties, and others still suppose them to be distinct species. Great confusion has prevailed in the nomenclature; the *panther* and *pardalis* of the ancients are not certainly known; the jaguar was erroneously described as the panther by Buffon; the puma is often called panther in America; the leopard is known by the name of tiger in Africa; and as sir J. E. Tennent tells us, it is by mistake often called cheetah in Ceylon. Supposing the leopard and panther to be one species, we may describe it as characterized by a peculiar gracefulness, slenderness, and flexibility of form, with a very long tail, and spotted fur, the spots being arranged in numerous rows along the sides, and each spot composed of five or six small spots arranged in a circle or rosette. The general color is yellowish; the lower parts lighter; the spots darker than the general color of the fur. The leopard is extremely agile, and possesses the power of leaping and also that of climbing trees in great perfection. It haunts wooded places, and is seldom to be found in open regions of long grass, like the tiger. When pursued it takes refuge, if possible, in a tree, and if hard pressed, springs down on its assailants. It is cunning, and adopts devices similar to those of the fox for carrying on its depredations and concealing its place of retreat. Deer and antelopes are its habitual prey; but it is equally ready to feed on pigs, poultry, or whatever may be found in the vicinity of a farm or village. The size and strength of the leopard render it as dangerous to man as any of the *felidae*; but it generally seems to dread and flee from man, unless assailed. It is very capable of domestication.

LEOPARD, in heraldry. The leopard has been described by some heralds as the issue of the pard and lioness; and the circumstance that such hybrids are unproductive, is assigned as a reason for appropriating that animal to the armorial ensigns of abbots and abbesses. However, the representations of leopards, at least in English heraldry, are so exactly like those of the lion passant gardant, that it has been made a question whether there is any difference between the two, and it has more especially been a keenly contested point whether the three animals in the royal escutcheon of England were lions or leopards. In early times we find them blazoned in both ways, and the true solution of the *questio vexata* seems to be, that at one period the heraldic leopard came to be considered as a mere synonym for the lion passant gardant, though the two animals were originally regarded as distinct. In the infancy of heraldry, before distinctive appellations were invented for the different attitudes of animals, it was customary to draw a lion in the attitude since called rampant, and a leopard as passant gardant. This difference of position sufficiently indicating which animal was meant, they were otherwise similarly represented, and no attempt was made to exhibit the spots of the leopard. By and by, as coats of armor were multiplied, it became necessary to difference them by varying the position of the animals depicted; and the blazoners of those days, thinking more of attitude than of zoology, had recourse to a compromise in their nomenclature. The lion was naturally supposed to be rampant and in profile, the leopard passant gardant. When the conventional animal that might stand for either was passant and in profile, he was designed a *lion-leopardé*; and when rampant gardant,

he was a *leopard-lionné*. The king of beasts was very early assumed as his appropriate insignia by the sovereign of England as well as by the sovereigns of other countries in western Europe. The lion was at first borne singly, and his natural attitude, like that of other lions, was considered to be rampant. But when a second and third lion were added, it became less convenient to draw them in the rampant attitude, and the lions became lions-leopardé or passant, as seen in the seal of king John; a further change of position to passant gardant made them heraldically leopards. Edward III., Edward the black prince, and Richard II., speak of their crest of the leopard. Nicholas Serly was designated leopard herald in the reign of Henry IV.; and it was not till the middle of the 15th c. that the lions of England regained their original name.

Though leopards, properly so called, hardly occur in English heraldry, having passed into lions passant gardant, their heads or faces are occasionally borne. If no part of the neck is shown, the proper blazon is a leopard's face; if a portion of the neck is drawn, it is a leopard's head, erased or couped, according as it is cut off evenly or with a jagged edge.

LEOPARDI, GIACOMO, Count, a modern poet and classical scholar of Italy, was b. at Recanati, a town in the march of Ancona, on June 29, 1798. Without the aid of instructors, Leopardi, at the age of 17, had attained to a degree of classical scholarship almost marvelous. Latin and Greek he mastered as his own mother-tongue, and composed some of his philological criticisms at the age of 19, when he was elected member of the academy of science at Viterbo. Shortly after, he departed from his secluded home for Rome, where he won the friendship of several celebrated men, amongst others, of Niebuhr, who was deputed to offer him the chair of Greek philosophy, in the university of Berlin, which he declined. Ill health acting on the temperament characteristic of genius, seems to have cast a gloom over his spirit, which deeply tinged his general impressions of men and things. On his return from Rome to his native place, his health grew seriously impaired, from the ardor with which he pursued his varied studies. He finally took up his abode in Florence, where he published his admired *Canzoni* and other works, amidst a conflict with failing health, straitened finances, and deep despondency. In this bitter crisis of his life, he formed a warm friendship with the historian, Antonio Ranieri; and by the delicate and incessant cares of Ranieri and his sister, the shattered, suffering poet was shielded to the hour of his death. From this period, a sensible softening of spirit became manifest in his writings; it seemed as if the poet had learned to value and cling to life and friends only when summoned to relinquish both. He died in his friend's arms at Naples, June 14, 1837, at the age of 39. His remains lie in a small church at Posilippo. The works of Leopardi are all more or less the reflex of his morbid, desponding mind. They are remarkable for originality, vigor, and elegance of style. His collected works were published in 1849, by Le Monnier, at Florence, under the title of *Versi e Prose di Giacomo Leopardi*. His Italian lovesonnets are full of fire and grace; and his ingenious imitations of the antique form of composition, written in Greek and Latin, were so perfect, as to be mistaken by many for genuine long-lost gems of classical literature.

LEOPOL. See LEMBERG, *ante*.

LEOPOLD I., GEORGE CHRISTIAN FREDERICK, King of the Belgians, son of Francis duke of Saxe-Coburg, was b. Dec. 16, 1790. He received an excellent literary and scientific education, and at the conclusion of his studies had the reputation of being one of the best informed princes in Europe. The marriage of his sister Juliana with the grand duke Constantine having closely allied the house of Saxe-Coburg with the imperial family of Russia, he became a gen. in the Russian army; but the menaces of Napoleon compelled him, in 1810, to resign his commission. He afterwards again joined the Russian army, and was present at the battles of Lützen, Bautzen, Leipsic, and Kulm. Having visited England after the peace of 1815, he won the affections of the princess Charlotte, the heiress of the throne. Leopold was now naturalized by act of parliament in 1816, and received an annual pension of £50,000. The marriage took place on May 2, 1816; but the princess died in child-bed on Nov. 5, 1817, and her child did not survive. Prince Leopold now lived in complete retirement, sometimes in London, and sometimes at his seat of Claremont. He received, in Feb., 1830, the offer of the crown of Greece, and at first favorably entertained the proposal, but afterwards rejected it, because of the dissatisfaction of the Greeks with the arrangements determined upon by the great powers. In June, 1831, he was elected, by a national congress, king of the Belgians, and on July 21 of that year his inauguration took place at Brussels. In 1832 he married the princess Louise, daughter of Louis Philippe, king of the French, who died in Oct., 1850, by whom he had issue the crown prince Leopold, duke of Brabant, another son and a daughter. As a monarch, he conducted himself with great prudence, firmness, and moderation, with constant regard to the principles of the Belgian constitution. He died Dec., 1865, and was succeeded by his son, Leopold II.

LEOPOLD II., LOUIS PHILIPPE MARIE VICTOR, King of Belgium, b. April 9, 1835, a son of king Leopold I. and queen Louisa, daughter of Louis Philippe of France. Married in 1853 to Marie Henriette, a daughter of the archduke Joseph of Austria; ascended the throne, Dec. 10, 1865.

LEOPOLD I., Emperor of Germany, 1640-1705; b. Austria, son of Ferdinand III., of the house of Hapsburg, and of Maria Anna of Spain. He was educated for the church, but on the death of his brother in 1655 he ascended the throne of Hungary, and in 1657 was proclaimed king of Bohemia. In 1658, after the death of Ferdinand III., a contested election for emperor was decided in his favor and against Louis XIV. of France, notwithstanding that the latter had gained four of the electors over to his side. His reign, continuing through the half century that followed, was remarkable for the number of important wars which occurred, making that period an eventful one for the whole continent of Europe, in all of which he was prominently concerned. In 1657 he assumed the government of the hereditary states of the house of Austria, and, finding that the Turks had invaded Hungary and Moravia, he made war on them, and with his gen., Montecuccoli, an Italian, completely routed them at the battle of St. Gothard, near Kenhausen, in 1664, after which a truce of 20 years was arranged. In July, 1683, he was defeated near Raab by an army of 200,000 men, the combined forces of the porte, under Kara Mustapha, and the disaffected Hungarian nobles, with Tekeli (whom they chose as their leader in 1682), who had joined the Turks, Louis XIV. secretly inciting the Turkish invasion. In Sept., 1683, with Sobieski of Poland, who marched from Cracow with 16,000 men, and the duke of Lorraine with 70,000 men of the imperial forces, who made a junction at the Danube, he fought a battle in the vicinity of the Austrian capital, defeated the Turks, who had captured it, saving Vienna, and ridding Hungary of the Turkish troops after a series of desperate encounters. In 1686 Buda was retaken after a memorable siege. In 1687 the diet of Presburg acquiesced in the proposition to make the male line of the Hapsburgs hereditary in Hungary. In 1691 occurred the victory of Zalánkemén. In 1697 he brought the Turkish war to a close, by gaining, with prince Eugene, a great victory near Zenta in Hungary, and obtained secure possession of Transylvania in 1699. In 1701 he renewed his alliance with England and Holland, and in the following year a number of victories were won by his army under command of prince Eugene, and in 1704 the triumph of Blenheim in connection with the allied powers. He carried on three wars against Louis XIV., one followed by the treaty of Nimwegen in 1678, one the peace of Ryswick in 1697, and the war of the Spanish succession, in which his son, the archduke Charles, laid claim to the throne made vacant by the death of Charles II. in 1700, and the termination of which, as well as that of the great Hungarian insurrection under Franz Rakoczy, he did not live to see. The most significant events of his reign were the establishment of a ninth electorate in favor of Ernest Augustus, duke of Brunswick-Lüneburg, who in 1692 became the first elector of Hanover; the assumption of the regal title by Frederic, elector of Brandenburg and duke of Prussia, in 1701; and the establishment of a permanent diet, attended by the electors' representatives instead of the electors in person. He was married three times; his first wife was Margarita Theresa, a Spanish princess. He was succeeded by his eldest son, Joseph I.

LEOPOLD II., Emperor of Germany, 1747-92; b. Germany; son of emperor Francis I., of Lorraine, and Maria Theresa of Austria, and brother of Marie Antoinette. In 1765, on attaining his majority, he succeeded to the throne of Tuscany, which had been taken in the place of Lorraine, as Leopold I. of Tuscany, and ruled 25 years. He then resided in Florence. He governed with great discretion, advocating reform in every department of church and state, making a revolution in ecclesiastical matters, establishing a new criminal code and penitentiaries. In 1782 he abolished the inquisition, and during his reign removed the penalty of death, equalized the land tax, and favored free trade. He founded schools and almshouses. In 1790, on the death of his brother, Joseph II., he assumed the government of the Austrian dominions and the German empire, and removed to Vienna. Finding that with his possessions he had inherited a troubrous condition of state affairs, in 1790 he made satisfactory terms with Frederick William II. at Reichenbach, and was unanimously elected emperor of Germany. Out of respect to Hungary, he bound himself by an oath to act strictly in accordance with constitutional law, restoring to the Belgians the privileges of which they had been deprived, and giving Tuscany to his son Ferdinand. In 1791 pacific terms were arranged with Turkey at Sistova, and at Pilnitz, in a council composed of Frederick William Augustus of Saxony and others, a plan was concerted relative to the anticipated movement of the French revolution and the restoration of Louis XVI. In 1792 he formed an alliance with Prussia. His wife was Maria Louisa, daughter of Charles III. of Spain. He had 16 children. His eldest son, Francis, was the last of the elective rulers, and was styled Francis I. of Austria and Francis II. of Germany. In 1874 his correspondence with Francis II. and the empress Catharine was published.

LEOPOLD II., Grand Duke of Tuscany, 1797-1870, a son of the grand duke Ferdinand III. In 1847 he granted a free constitution; fled to Naples in 1849, but was recalled by his subjects shortly afterwards. The national troubles that followed compelled him in 1859 to flee with his family to Vienna. In doing so he abdicated in favor of his son, but this action was disregarded, Tuscany being by vote of the people incorporated into the kingdom of Italy. Died an exile in Bohemia.

LEOPOLD I., Prince of Anhalt-Dessau, 1676-1747. The emperor, Leopold I., observing his passion for military affairs, made him in 1688 col. and chief of a regiment of horse. On the death of his father, a Prussian field-marshall, in 1693, he entered the Prussian service and took command of his father's regiment. He was shrewd, passionate, and self-willed, and having as a youth fallen in love with the daughter of a druggist, married her in spite of all remonstrances when he became of age, inducing the emperor to raise her to princely rank. From 1698 to 1713 he served with distinction and in very responsible positions under Eugene and Marlborough in the Netherlands, on the Rhine, and in Italy, and when Frederick William I. ascended the throne of Prussia, he placed him at the head of the army. He was the very incarnation of the military spirit, and the later triumphs of the Prussian army may be traced to the influence of his genius for military organization and discipline. He was great alike in the capacity for details and in the qualities which fit men to handle the largest armies. In the Swedish and Silesian wars he won great distinction. Died at Dessau.

LEOPOLD OF BABENBERG or BAMBERG, the descendant of a noble family which derived its origin from the Frankish kings, was the first hereditary markgraf of Austria (983 A.D.), and his descendants continued to rule over that country till the line became extinct, in the person of Frederick the warlike, in 1246. This family played an important part in the Guelph and Ghibelline conflicts of the 12th c., and obtained the duchy of Bavaria, in 1138, on the rebellion of Henry the proud, but after a long conflict with his son, Henry the lion, was compelled to resign it to that prince in 1156.

LEOSTHENES, a distinguished gen. of Athens, a favorite with the mercenary soldiery, who chose him for their leader. He was famous for the warmth with which he espoused the cause of democracy, and the violent tone of his speeches drew forth the wise reproof of Phocion: "Young man, thy words are like the cypress, tall and large, but they bear no fruit." He belonged to the party of Demosthenes. Among his exploits were the defeat of the Boeotians, near Platea, and the successful opposition to the entrance into Greece of Antipater, at Pylæ, whom he defeated and imprisoned in Lamia, a town in Thessaly. From this siege the Lamian war took its name, and in one of the battles he was killed. His portrait was painted by Arcesilaus, and placed in the Peiracus, where it was esteemed by Pausanias an object worthy of notice. He left an untarnished reputation, but with him passed away the last remnant of the glory of Athens.

LEPANTE, NICOLE REINE ÉTABLE DE LABRIÈRE, Madame, 1723-88; b. Paris; was married in 1748 to the famous mechanician and clock-maker Jean André Lepante, and was the principal author of his *Traité d'horlogerie*. She assisted Clairaut and Lalande in the calculation of the return of Halley's comet in 1757. She was the author of *Observations* published in the *Connaissances des Temps*, an astronomical annual of the academy of sciences; of *Tables of the Sun, Moon, and Planets*; of *Expositions du calcul Astronomique*.

LEPANTO (ancient *Naupae'tus*), now called by the Greeks *Epacto*, the chief town of the eparchy of the same name, in the province of Ætolia-Acarnania in Greece, is situated on the n. side of the gulf of Lepanto, 25 m. e. of Missolonghi. The town, which is ill built, and has a miserable appearance, is the seat of an archbishop, and has an excellent port. Pop. 2,600. In the middle ages it was given by the Greek emperors of the east to the Venetians, who fortified it so strongly, that in 1477, it stood a siege of four months by 30,000 Turks, and was only taken in 1499 by Bajazet II., at the head of 150,000 men. Near Lepanto took place the celebrated naval battle between the Turks and Christians in 1571, in which the latter, commanded by Don John of Austria (q.v.), achieved a decisive victory.

LEPANTO, BATTLE OF, a naval engagement fought Oct. 7, 1571, in the gulf of Lepanto, near Corinth, between the combined fleets of Spain, Venice, Genoa, Malta, and the papal states against the whole maritime force of the Turks. The Christian allied fleet, consisting of 210 sail, was commanded by Don John of Austria. The Ottoman fleet numbered about 300 galleys under command of Ali Pasha. The Christian fleet was met by the Turks where the gulf of Patras flows into the gulf of Lepanto; the Turkish line was broken, the admiral Ali was killed, and Cervantes was dangerously wounded and his left hand rendered useless for life. The Venetian ships making an attack at the same time on the Turkish right, a crushing defeat of the Turks was accomplished, but Barbarigo, the Venetian commander, was mortally wounded. More than 3,000 Christians were killed. The Turks lost 30,000 men in killed and wounded, and 107 galleys were taken, besides a large number sunk. Thousands of Christian galley slaves were liberated by this victory. The Christian fleet having been stationed, previous to the attack, at the mouth of the Achelouïs river in the neighborhood of the Curzolari islands, the name of the latter has been given to the battle by Italian writers.

LEPANTO, GULF OF, a considerable body of water lying n. of the isthmus of Corinth, s. of Hellenas, and n.e. of the Morea. It is 75 m. in length and about 13 m. in breadth, except where the bay of Salona (the Crissæan gulf of the ancients) stretches away for 8 m. toward the n., where the bay of Corinth extends to the s.e. and in the direction of the Alcyonian sea, now called Livadostro bay. It once included the gulf

of Patras, and was called the Corinthian gulf. It is fed from the w. by the gulf of Patras, through the straits of Lepanto, sometimes called the Little Dardanelles, which flow past the city of Lepanto, connecting the gulf with the Mediterranean. The adjacent country presents an irregular coast line; the soil is generally fertile and the surface is hilly. The gulf in such environment presents the appearance of a picturesque inland lake.

LEPIDODENDRON, a genus of fossil plants, abundant in the coal measures. Some species were of small size, but the greater number were large trees, 40 or 50 ft. long, and more than 4 ft. in diameter. They taper upwards, and branch generally in a dichotomous manner. The surface is either covered with narrow, sharp-pointed, scale-like leaves, or marked with lozenge-shaped spaces—the scars of the fallen leaves—arranged in a spiral manner. The leaves which are found separated from but associated with the trunks have been placed in a provisional genus under the name of *lepidophyllum*. The fruits are elongated, cylindrical bodies, composed of a conical axis, around which a great quantity of scales are compactly imbricated.

Brogniart and J. D. Hooker consider that lepidodendra are gigantic lycopods. Their modern representatives would thus be a class of small, generally creeping, moss-like plants, the largest not being more than 3 or 4 ft. high. In their form and in the structure of their fruit, they certainly approach them more nearly than any other living plants. Lindley, however, sees in the coniferae, and especially in the Norfolk island pines, the closest resemblances to this ancient class of plants.

LEPIDOPTERA (Gr. scaly-winged), an order of insects, undergoing complete metamorphosis, having the mouth in their perfect state exclusively adapted for sucking, and further characterized by four membranous wings covered with minute, closely set scales. The order contains a vast number of species, abounding chiefly in warm climates; but the British species alone are about 2,000. The lepidoptera are very naturally divided into three great sections—*diurna*, *crepuscularia*, and *nocturna*, so named because almost all those of the first section are to be seen on wing only during the day, those of the second more generally during the twilight, whilst those of the third are more nocturnal; their popular designations respectively being BUTTERFLIES, HAWK-MOTHS, and MOTHS. See these heads. Among the lepidoptera are included many of the largest and most beautiful of insects, with colors as exquisitely varied as they are brilliant; there are also many—particularly among the moths—of small size and sober hue, but not one of them can be denied the praise of beauty. The difference between the larvæ and the perfect insects in food, structure, and habits, is very wonderful. The larvæ are described in the article CATERPILLAR, the pupæ in CHRYSALIS. The perfect insect feeds only on the nectarious juices of plants. The principal organs of the mouth are the *maxillæ*, the mandibles and labrum being reduced to mere rudiments; and the maxillæ appear in the form of two long slender filaments, which combine to form a proboscis or trunk, spirally rolled up when not in use. This trunk is capable of great variety of movement, and is of extremely delicate structure.—The scales of the wings are of very various forms, but with a general similarity. Some of them are figured in the article BUTTERFLY. The wings are generally large, and are not folded when at rest. The three segments of the thorax are much united. The abdomen has neither sting nor ovipositor. None of the lepidoptera form societies, although great numbers are often found together. SILK is the product of some of them.

LEPIDOSIREN (or *protopterus*), a very remarkable genus of animals, one of the connecting links between amphibia (or batrachia) and fishes, and ranked by some naturalists with the former, and by some with the latter. Owen strenuously maintains the proper place of this genus to be among fishes. There are several species of lepidosiren, of which the best known is *L. annectans*, an inhabitant of the upper part of the river Gambia. It is about a foot long. The bones are very soft and cartilaginous, or even gelatinous, except those of the head, which resemble in substance those of osseous fishes. The scales are cycloid. The dentition is very remarkable. The jaws are furnished with an undulating ribbon of bone, covered with enamel, the undulations of the upper and lower jaw adapted to each other, and along the edges are small sharp teeth. There are free filamentary gills situated under gill covers, as in osseous fishes, but two of the arterial arches, which ordinarily supply the gills of fishes with blood, are represented in lepidosiren by trunks, which proceed to the double air-bladder, and ramify over its cellular surface, so that the air-bladder, having a communication with the mouth, is capable of serving to a certain extent the purposes of lungs, and the animal is enabled to sustain a torpid existence during the dry season in mud, in which it forms for itself a kind of nest, which has been likened to the cocoon of an insect, by means of a mucous secretion from its body. Specimens of *L. annectans* have sometimes been brought from Africa with plants, among the roots of which they have taken up their residence. Numerous specimens have been kept alive in the zoölogical gardens of London and the Crystal Palace, and their habits have been carefully studied. They do not seem to need the annual period of torpidity, for which, as forced upon them in their native country, they are so well prepared. They readily eat any kind of animal food; frogs are particularly acceptable; and when placed in the same tank with gold-fishes, they kill them by a single bite close to the pectoral fins, approaching them from below, biting out the piece, and

often eating no more of the fish than that one bite. In its native country, the flesh of the lepidosiren is much esteemed.

LEPIDOSTE'IDÆ, a family of fishes which are the only living representatives of the order *rhomboganoideæ*. They have an elongated, nearly cylindrical body, covered with rhomboidal scales. The head terminates in a long, beak-like snout, with nostrils near the end of the upper jaw, which is longer than the lower. The dorsal fin is set well back and above the anal fin. They include the genus *lepidosteus*, to which the gar and alligator gar-fish of the North American lakes and rivers belong. They somewhat resemble the true gar-fishes in appearance. See GAR-FISH, *ante*.

LEPIDUS, an illustrious Roman family of the ancient Æmilian gens. It makes its first appearance in history about the beginning of the 3d c. before Christ, and was long one of the most distinguished in the patrician order, reckoning among its members many who held the greatest dignities in the state, consuls, augurs, pretors, military tribunes, censors, and heads of the priesthood. It disappears about the close of the 1st c. A.D. The only individual, however, who requires special mention, and that not because of his talents, but because of the important events in which he took a part, is MARCUS ÆMILIUS LEPIDUS, who, when war broke out (49 B.C.) between Cæsar and Pompey, declared for Cæsar, who appointed him, during his own absence in Spain, dictator of Rome, a *magister equitum* (47 B.C.), and his colleague in the consulate (46 B.C.). He afterwards supported Antony, and became one of the triumvirate with Octavianus and Antony; but his weakness of character, and want both of military talents and of statesmanship, made him of very inferior importance to the other two, who assigned him Africa as his province (40-39 B.C.). After the defeat of Sextus Pompeius, he thought to have maintained himself in Sicily against Octavian, but his soldiers deserted him, and went over to his rival, who, however, allowed him to retain his wealth and the dignity of pontifex maximus. He died 13 B.C.

LEPIS'MA, a genus of wingless insects, of the order *thysanura*. The best known species is *L. saccharina*, sometimes called the *sugar louse*, because it is often found about old sugar barrels. It is said to have been introduced into Britain from America. All the species of lepisma and of the family *lepisimidae* inhabit moist places, and feed on decaying vegetable substances. They have a flattened, spindle-shaped body, terminating in three long bristles. They run swiftly. They are mostly covered with silvery scales, which are much used as test objects for the microscope.

LE'PORIDÆ. See HARE.

LEPORIDE, the name given by the French to a remarkably prolific hybrid between the common European hare and the rabbit. It is extensively bred in France, where it is highly esteemed for food.

LEPRA is a Greek term which is now generally employed by medical writers to designate a scaly affection of the skin. These scales occur in circular patches of a grayish color, with a red, slightly elevated margin. If the scales fall off or are removed, the surface of the skin is red and shining, and new scales rapidly form. The patches vary in size, being often about an inch in diameter, and sometimes much larger. Lepra most commonly occurs on the limbs, and especially on those parts where the bones are most thinly covered. Its duration is uncertain, and if not interrupted by treatment, it will frequently continue for years, without materially affecting the general health. It is not contagious. The local application of tar ointment, or the iodide of sulphur ointment, will sometimes remove it. If it does not yield to this treatment, small doses of Fowler's arsenical solution (3 to 5 minims) may be prescribed, twice or thrice a day, either in water or in the decoction of dulcamara, which is supposed to be specially beneficial in chronic skin diseases.

LEPROSY. This term has been very vaguely used both by medical and other writers; we shall here restrict it to the *lepra tuberculosa*, as it appears to have prevailed during the middle ages and down to modern times in Europe, and as it is now met with in various warm climates; the scaly variety, which in reality is a perfectly separate disease, being noticed in the article LEPRA. The affection here discussed is identical with the *elephantiasis of the Greeks*, and the *lepra of the Arabians*, while it is altogether different from the *elephantiasis of the Arabians*, and the *lepra of the Greeks*, which latter is the scaly *lepra* of our own day.

The most prominent symptoms of leprosy are summed up by Dr. Copland in his *Medical Dictionary* as follows: "Dusky red or livid tubercles of various sizes on the face, ears, and extremities; thickened or rugose state of the skin, a diminution of its sensibility, and falling off of the hair, excepting that of the scalp; hoarse, nasal, or lost voice; ozæna; ulcerations of the surface and extreme fetor. These tubercles vary in size from that of a pea to an olive. Of all parts, the face is particularly affected, and especially the nose and ears."

The leprosy of Iceland, described by Dr. (afterwards sir Henry) Holland and others, that of the Faroe and Shetland islands, described by Dr. Edmonston and others, and that still met with in Africa, in the East and West Indies, and in many tropical islands, are all identical with the disease now described—the leprosy of the middle ages.

Closely allied to it, and often confounded with it, are: 1. The *lepra anæsthesiaca* of U. K. VIII.—52

Winterbottom, Copland, and others, which is characterized by remarkable absence of sensibility of the general surface, by comparative smoothness of the skin, and ulceration and falling off of the fingers and toes. The cases recorded by Winterbottom and Copland were seen in Africa.

2. The *Jewish leprosy*, regarding which nothing certain is known. The term leprosy (or *berat* in the Hebrew) was probably applied by the priests to various cutaneous affections, particularly those which were of a chronic and contagious nature. "It is probable," says Dr. Copland, "that frambeësia or the yaws (a tuberculous disease) was one of these, as well as other inveterate cutaneous maladies arising from the modes of living, the habits and circumstances of the Jews at that time, and of the Egyptians; and that these maladies have changed their characters, owing to changes in the nature and combinations of their exciting causes."

Nothing certain is known regarding the causes of this disease. The investigations of Mr. Stewart at Tranquebar, where it is very prevalent, led him to conclude: 1. That women are less liable to this malady than men; 2. That it is hereditary; 3. That its contagiousness is extremely problematical; 4. That a fish-diet is found to render every symptom worse; 5. That poor living, want of cleanliness, and exposure to cold and damp, are constant attendants on this affliction. Dr. Copland ascribes its origin to the use of semi-putrid meat and fish, and of rancid oils; to insufficient vegetable food; and to the contact of matter discharged from leprous sores.

The disease may continue without causing death for many years. When it is far advanced, it is probably incurable and even in the early stages its cure is uncertain. Probably such alterative medicines as corrosive sublimate and arsenious acid in minute doses are the most likely to be of service. Sulphur fumigating baths and various medicated water-baths have also been recommended.

LEPSIUS, KARL RICH., a distinguished German investigator of Egyptian antiquities, was b. at Naumburg, Dec. 20, 1813. His father, an advocate and magistrate there, was a zealous antiquary, and published many works on the antiquities of that part of Germany. The younger Lepsius studied at Leipsic, Göttingen, Berlin, and Paris. His first work was his *Die Paläographie als Mittel der Sprachforschung* (Berl. 1834), for which he obtained the Volney prize of the French institute. This was followed by works on the most ancient alphabets and other kindred subjects. In 1836 he associated himself intimately with Bunsen at Rome, and eagerly prosecuted his favorite studies there. Between 1834 and 1842 he published his *Lettre à M. Rosellini sur l'Alphabet hiéroglyphique* (Rome), and a number of dissertations on the monuments of Egyptian art and their general architectural style, which were inserted in the *Transactions* of the archaeological institute. He also applied himself to the study of the ancient Etrurian and Oscan languages, the remains of which he published in his *Inscriptiones Umbriae et Oscae* (Leip. 1841), and other works. In 1842 he was placed at the head of an antiquarian expedition sent to Egypt by the king of Prussia, and on his return was appointed ordinary professor in Berlin. His *Denkmäler aus Aegypten und Aethiopien* (in folio, 1853-57), a magnificent work, was published at the expense of the king of Prussia. His *Chronologie der Aegypter*, and *Ueber den ersten Aegypt. Goetterkreis*, laid the foundation for a scientific treatment of the earlier parts of Egyptian history. He has connected with the study of the more familiar departments of Egyptian archaeology the investigation of the languages, history, and monuments of the regions further up the Nile. Other works are *Briefe aus Aegypten, Aethiopien, und der Halbinsel des Sinai* (1852); *Ueber einige Ergebnisse der Aegyptischen Denkmäler*, etc. (1853); *Das allgemeine linguistische Alphabet* (1855), on which Lepsius based his *Standard Alphabet for Reducing Unwritten Languages and Foreign Graphic Systems to a Uniform Orthography in European Letters* (1863); *Die Altägyptische Elle* (1865); *Die Metalle in den Aeg. Inschriften* (1872). He has also written on Chinese, Arabic, and Assyrian philology.

LEPTANDRA, a generic name proposed by Nuttall for *veronica virginica*, or culvus physic. It is the pharmaceutical name for that plant, and the resinoid extracted from it has the name of *leptandrin* in the books and at the drug-stores. In America it grows in rich woods from Vermont and Wisconsin southward. It is often cultivated; blooms in July and Aug. Leaves whorled in fours to sevens; short leaf-stalk; leaf lanceolate, pointed, finely serrate; spikes panicled; stamens much exserted; corolla small, nearly white. See SPEEDWELL (*ante*).

LEPTOCARDIA, an order of fishes according to Müller's classification, including but a single living representative, the anomalous *amphioxus lanceolatus*, or lancelet. See LANCELET, *ante*, and PHARYNGOBANCHII.

LEPTOSPERMUM, a genus of trees and shrubs, natives of Australia, New Zealand, etc., of the natural order *myrtaceæ*, sub-order *leptospermeæ*. They are evergreen, with leaves somewhat resembling those of myrtles. Some of them bear the name of TEA-TREE, as *L. lenigerum*, *L. baccatum*, *L. flexuosum*, and *L. grandiflorum*, because the leaves have been used as a substitute for tea. *L. scoparium* is sometimes called the *New Zealand tea-plant*, sometimes the *broom-tree* or *dogwood-tree*. It is common both in New Zealand and Australia.

LEQUESNE, EUGENE LOUIS, b. Paris, 1815; admitted to the bar in 1839, but soon relinquished the law and applied himself to the study of sculpture at Rome under Pradier, and began to exhibit in 1845. His works are a "Dancing Faun," in the garden of Luxembourg; "Victory, on Napoleon's Tomb;" "Bathing Girl;" "Lesbia;" "A Roman Slave;" "Pegasus," for the new opera-house.

LERCARA DE' FREDDI, a t. of Sicily, in the province of Palermo, 30 m. s.s.w. from Palermo, in an inland mountainous district. Most of the inhabitants are employed in the sulphur mines of the vicinity, and the road to Palermo is much occupied by carts carrying sulphur for exportation. Pop. above 9,000.

LERDO DE TEJA'DA, SEBASTIAN, b. Jalapa, Mexico, 1825; educated at Puebla for the priesthood, but afterwards studied law at a college in the city of Mexico. He was received at the bar in 1851, and in 1855 was a magistrate, and two years later was made minister of foreign affairs. In 1861 he became a member of congress, and was re-elected, serving also as president of that body. In 1863 he was, first, minister of justice, and then minister of foreign affairs, always being allied with the liberal party. He was one of the most prominent leaders in opposition to the French intervention in Mexico, and preserved a consistent attitude of antagonism to the unfortunate Maximilian, the representative in Mexico of the aggressive policy of the French empire. The execution of the Austrian arch-duke may be legitimately charged to the determination of Lerdo de Tejada and Benito Juarez. On the return of the republican government to the capital in 1867, after the withdrawal of the French, Juarez was re-elected president, and Lerdo became vice-president, succeeding Juarez as president in 1872, on the death of the latter. In Oct. of that year he was elected president for four years. In 1875-76 a revolution broke out in several Mexican states at once, and gen. Porfirio Diaz came forward as the leader of the insurrection, having previously headed similar revolutionary movements. In July, 1876, an election took place, and Lerdo was continued at the head of the government, his term of office to expire in Nov., 1880. Diaz, at the head of an army, marched against the capital, and on Nov. 26, 1876, president Lerdo and his cabinet fled to Acapulco to take passage on the steamer running between San Francisco and Panama, leaving Diaz in supreme control of the government. Lerdo visited the United States early in 1877, and was hospitably received in New York and other principal cities. He has not since been prominent in political affairs. He is characterized as being profoundly skilled in politics and diplomacy, an astute and courageous leader, and a pronounced adherent of the policy of reform in his native country.

LERICI, a t. and port of n. Italy, on the gulf of Spezia, which has extensive lead-works belonging to an English company, the ores being brought from Sardinia. Pop. about 3,500. The port is frequented by numerous vessels; the town is walled, and protected by a castle. In the 11th and 12th centuries, Lerici was included in the territory of Pisa, when it was strongly fortified against the rival states of Lucca and Genoa. At Lerici the famous transfer of Andrea Doria's services from Francis I. to the emperor Charles V. took place.

LÉRIDA, a province of n.e. Spain, in the district of Catalonia; separated from France by the natural frontier line of the Pyrenees mountains, and the little republic of Andorra with its snow-capped mountain-peaks; 4,775 sq.m.; pop. 380,348. In the n.w. section are the peaks of Maladetta and Pic Nethou, rising to a height of 11,168 ft., the culminating point of the Pyrenees. It is drained by affluents of the Ebro, a rocky, rapid river, rising in the mountains and flowing s.e., and by the headwaters of the Tér and the Segre. Its valleys and plains are kept green and fertile by numberless little rivulets that trickle down from the mountains, and which, diverting the river water, make its soil the richest, as it is the most cultivated, in Spain. Its hills are well wooded, pine trees growing high up on the mountain side, and contain valuable mineral deposits. It contains several considerable fortified towns, with institutions of learning, including Lérida in the extreme s., one of the most important military posts in Spain.

LÉRIDA, a t. of Spain, capital of the province of the same name, on the river Segre, a tributary of the Ebro, about 100 m. w.n.w. of Barcelona. It is built partly on a plain and partly on an eminence. The town—which is important in a military point of view—is surrounded by walls and a wet fosse, and commanded by the citadel. It is a gloomy labyrinth of mean-looking streets. The castle has an old cathedral attached to it of the 13th c.; the town, a new and imposing one of the 18th century. Lérida carries on manufactures of woolen, cotton, leather, glass, and gunpowder. Pop. 19,627.

Lérida is probably the Celtiberian *Ilerdu*. In the neighboring plain, Scipio Africanus defeated Hanno, and at a later period Caesar, the lieutenants of Pompey. A council was held at Lérida 564 A.D.

LÉRINS, THE, islands of the Mediterranean sea, situated 2½ m. from the s.e. coast of France, between capes Roux and Guaroupe, belonging to the department of Alpes-Maritimes. The group includes two small islands of great historic interest. Ste. Marguerite (the Leron of the ancients), 2 m. in length, is nearest the seaport of Cannes, 15 m. s.w. of Nice, a favorite resort for invalids in the winter season, brought into public notice in 1837 by lord Brougham. At Frejus, near by on the mainland, Napoleon

anded when he escaped from Elba in 1815. It contains the garrisoned citadel, Monterey, now a military prison, where from 1686 to 1698 the mysterious "man in the iron mask" was imprisoned. It is shaded by thick woods, and from the same prison in 1874 marshal Bazaine made his escape by night. Its monastery of Ste. Marguerite held the royal captive Francis I., king of France, while on his way to Madrid, a prisoner of war. Its companion island, St. Honorat (the Lerina of the Romans), of even less area, contains the ruins of an abbey, the convent of Lerins, of the Benedictine order, with fortifications, founded by St. Honoratus, archbishop of Arles, becoming in the 5th c. the point where were centered the most vigorous theological minds of that age in Europe. Among its abbots appear the names of St. Vincent de Lérins and St. Hilary. Having been destroyed by the Saracens, the convent was restored by the Benedictines, but in the turbulent outbreak of the beginning of the French revolution it was reduced to a mass of ruins, and has since been inhabited only by a few monks.

LERMONTOFF', MIKHAIL IVANOVITCH, 1814-1841; was of a noble family; entered the military service; and early became an officer of the imperial guards. A poem written on the death of the poet Pushkin, who was killed in a duel in 1837, in which the author made severe insinuations against the court, so displeased the emperor Nicholas, that he struck him off the list of the officers of the guard, and sent him to serve in the army of the Caucasus, where he remained until his death. The poem, which long circulated in manuscript in Russia, was printed for the first time in 1856 in the *Polar Star*, a Russian periodical published in London. While in the Caucasus, he wrote a novel entitled *The Hero of our Time*. Pechorin, a fellow-officer in the army of the Caucasus, thinking himself described in the novel, challenged and killed Lermontoff. Most of his poems were composed while in the army, and published in St. Petersburg, gaining for him the title of the poet of the Caucasus. The most prominent were, *The Novice, or the Young Circassian*; *The Dream of Valerika*; *The Demon*; *The Song of the Czar Ivan Vasilievitch*; *Hadj-Abrek*, a drama; *Ismail Bey*. Most of these were collected after his death, and in 1852 a German translation was published in Berlin. Next to Pushkin, he is considered the most distinguished Russian poet of the Byronic school.

LERNE'ADA, an order of crustacea, having the mouth formed for suction alone, and in organization very inferior to any of the other crustaceans, so that the genus *lernea*, from which the order derives its name, was placed even by Cuvier not among crustaceans, but *entozoa*. The true relations of these creatures, however, after having been rendered probable by others, were finally demonstrated by Von Nordmann. A remarkable circumstance is that, when young, they resemble the higher crustaceans much more than in their mature state; having then organs for swimming, which they are capable of doing with great agility, and eyes—or an eye as in cyclops, to which they exhibit much general resemblance; whilst, when mature, they are fixed to a single spot, as parasites on fishes, and are destitute both of eyes and of organs of locomotion. The number of the lerneada is very great, each kind of fish having apparently its own peculiar species of parasite. Some of them adhere to the eyes of fishes, which they render blind, some to the gills, some to other parts of the body. The ancients were acquainted with such parasites of the tunny and sword-fish, and Aristotle mentions them as causing great annoyance to the fishes infested by them. The lerneada assume in their mature state very various and grotesque forms.

LERO, or LEROS, an island off the s.w. coast of Asia Minor near Caria, and not far from the mouth of the Mēndere river. It forms one of a cluster of islands in the Ægean sea, called the Sporades, and is governed by Turkey; n. lat. $37^{\circ} 10'$, e. long. $26^{\circ} 50'$; pop. 2,000. It is 9 m. in length, varying from one-half to 4 m. in breadth. On the e. side are interesting ruins of a castle; also a considerable town, Lero, overlooking a bay. It was colonized about 500 B.C. The coast is irregular, the surface is mountainous, and the soil in the valleys is fertile, producing grain, olives, wax, and honey. Sheep are raised to some extent. The site of an ancient temple dedicated to the goddess Artemis Parthenos is now occupied by a convent.

LEROT. See DORMOUSE, *ante*.

LEROUX, PIERRE, 1798-1871; b. France; having pursued a course of scientific study in the schools of Paris and Rennes, entered a printing-office in the French capital. In 1824, with De Broglie, Cousin, and others, he established the *Globe*, a newspaper of a literary and philosophic character, which expounded the views of the *doctrinaires*, and afterward in the revolution of 1830, when in sole charge of the journal, he embraced the tenets of the St. Simonians and helped to disseminate their doctrines. In 1831, a year before the career of Enfantin, one of the founder of St. Simonism, culminated in imprisonment, he separated from him, and joined Jean Ernest Reynaud as his collaborator on the *Revue Encyclopédique*, which they conducted for three years with small success. In 1838, with the same associate, he commenced the *Encyclopédie Nouvelle*. In 1839 he published *De l'Humanité de Son Principe et de Son Avenir*, elucidating his philosophical and socialistic ideas, and giving his conception of the progressive nature of all things. In 1841, associated with Viardot and Mme. George Sand, he established the *Revue Indépendante*. In 1845 he removed to Boussac, devoted himself to journalism in the direction of radical politics, and was elected mayor; he was also chosen representative

to the national assembly. In 1851 he took up his residence in Jersey, but in 1869 in the general amnesty he returned to Paris, having passed some time in Switzerland. As a socialist he is considered pure, honest, and genuine in his convictions, combining mystical doctrine with a system for social organization. In 1843 he published a translation of Goethe's *Werther*, with a preface by Mme. George Sand. Besides several works of greater pretensions he published *Job*, a drama, and *The Samarese Beach*, a philosophic poem.

LE ROY, a village and township of Genesee co., N. Y., 25 m. s.w. of Rochester and 50 m. e. of Buffalo, on the Erie, Central, and State Line railroads. Pop. of village, 2,634; of township, 4,627. It has 7 churches, 2 banks, 2 weekly newspapers, and various mills on Oatka creek. It is the seat of Ingham university for ladies, and has an academic institute, an art conservatory, and a public library.

LEROY, WILLIAM E., b. N. Y., 1818; entered the navy as midshipman in 1832, promoted to be a past midshipman in 1838, a lieut. in 1843, a commander in 1861, a capt. in 1866, a commodore in 1870, and a rear-admiral in 1874. He commanded the *Keystone State* in the engagement with confederate iron-clads off Charleston in Jan., 1863, and the *Oneida* at the battle of Mobile bay, Aug. 5, 1864, and on both occasions was conspicuous for skill and bravery.

LEROY DE SAINT ARNAUD, JACQUES, a French marshal of the second empire, was b. at Paris, Aug. 20, 1801, entered the army in 1816, but found it necessary more than once to leave it, so that, in 1831, after a lapse of fifteen years, he was only a lieutenant. In 1837 he was appointed captain of the foreign legion, and first rose to eminence in the African wars. The valor he exhibited at the siege of Constantine won him the cross of the legion of honor. In 1840 he became a *chef de bataillon*; in 1842 a lieut. col.; and in 1844 a colonel. During the rising of the desert tribes under Bou-Maza, col. Leroy de Saint Arnaud signalized himself at the head of the column placed under his orders, reduced the Dahra to subjection, and made Bou-Maza a prisoner. On the termination of the campaign he was promoted to be a commander of the legion of honor. In 1847 he was raised to the rank of a field-marshal; and in the early part of 1851 carried on a bloody but successful warfare with the Kabyles. He was now appointed a general of division. At this period Louis Napoleon was plotting the overthrow of the republic, and was on the look-out for resolute and unscrupulous accomplices; and accordingly, about the beginning of autumn, Leroy de Saint Arnaud appeared in Paris, and was immediately appointed to the command of the second division of the city forces. On Oct. 26 he became war minister, and took an active part in the *coup d'état* of Dec. 2, and the subsequent massacres at the barricades. On the breaking out of the Crimean war in 1854 he was intrusted with the command of the French forces, and co-operated with lord Raglan in the battle of the Alma, Sept. 20. He died nine days afterwards, the victim of an incurable disease.

LEROY D'ETIOLLES, JEAN JACQUES JOSEPH, 1798-1860; b. Paris; educated at the imperial lyceum, studied medicine and took his degree of M.D. in 1824. In 1822, before graduating, he presented to the academy of surgery a set of instruments of his invention for performing the operation of lithotomy (q.v.). The invention was claimed by Civiale and Amussat, and it was only after an examination by the academy that it was awarded to Leroy d'Etiolles. In 1831 the academy awarded him a prize of 6,000 francs for the lithotomy forceps. He was the author of other surgical inventions and of a *Histoire de la Lithotritie* (1839), and also translated into French *Cooper's Dictionary of Surgery*.

LER'WICK, a burgh of barony, chief t. of the Shetland islands, is situated on the main-land, on Bressay sound, in lat. $60^{\circ} 9' n.$, and long. $7^{\circ} 8' w.$, 110 m. n.e. of Kirkwall. Lerwick has no regular streets, the only thoroughfares between the houses being badly-kept and winding pathways. The harbor is commodious and safe. Pop. '71, 3,516. In 1875, 458 vessels, of 76,721 tons, entered and cleared the port. Fishing is the chief branch of industry. Valued rent, £6,087 in 1873-74. See SHETLAND.

LERY', JEAN DE, b. Geneva, Switzerland, 1584; the first Protestant who preached on the American continent. He was a Calvinistic minister, engaged in the expedition organized by Villegagnon under the protection of the great Protestant statesman Coligny, to plant a French Protestant colony in Brazil. The colony was planted on an island in the bay of Rio Janeiro in 1558, where Lery preached to the colonists until, by the treachery of Villegagnon, and the attacks of the Portuguese a few years afterwards, the colonists were forced to retire, mostly returning to France. Lery went to France, and in 1560 was living in Geneva; afterwards he was pastor of congregations in various cities of France. Many of his associates were victims of the massacre of St. Bartholomew.

LESAGE, ALAIN RENÉ, a French dramatist and novelist, b. May 8, 1668, at Sarzeau, now in the department of Morbihan, and studied under the Jesuits. In 1692 he came to Paris to pursue his philosophic and juristic studies, and to seek employment. His personal qualities attracted the favorable regard of a lady of rank, who offered him her hand; but in 1695 he married the daughter of a citizen of Paris. He renounced the practice of his profession as an advocate to devote himself to literature, and lived entirely by his literary labors, till the abbé de Lyonne gave him a small pension of 600

livres. Some of his dramatic pieces attained great popularity; and in 1709 he was offered 100,000 francs to suppress one of them, *Turcaret*, a bitter satire on the financiers of the time, but he refused the offer. His comic novels, which have never been excelled by anything of the same kind, won for him a still higher place in literature, particularly *Le Diable Boiteux*, *Les Aventures de Guzman d'Alfarache* (an abridged translation from the Spanish of Aleman), and *Gil Blas de Santillane* (2 vols. Par. 1715), which is universally regarded as his masterpiece. He died Nov. 17, 1747. A complete edition of his works was published in Paris in 1730. The novels above named have been translated into different languages, and *Gil Blas*, in particular, is extremely popular.

LES'BOS, the ancient name of an island in the Grecian archipelago, belonging to Turkey, called, during the middle ages, *Mitylene* (from its capital city), and hence, by the modern Greeks, *Mitylini*, or *Melino*, and by the Turks *Midilli*. It lies 40 m. s.e. of Lemnos (q.v.), near the coast of Asia Minor, from which it is distant only 10 m.; area, about 600 sq.m.; pop. about 40,000, of whom from 15,000 to 18,000 are Turks, the rest are Greeks. Lesbos is rather mountainous, but only one of the mountains attains an elevation of 3,000 feet. The climate is salubrious beyond that of any other island in the Ægean, and the soil is fertile. Anciently, it was famous for its wines—Horace celebrates the *innocentis pocula Lesbii*—but the modern produce is indifferent. Its figs, however, are excellent; but its principal exports are oil, timber, and gall-nuts. The chief town is Castro (q.v.). Lesbos was the birthplace of Terpander, Arion, Alceæus, Sappho, Pittacus, Theophrastus, and Cratippus.

LESCARBOT, MARC, 1570–1630; b. France. His work entitled *Discours sur la réunion des Églises d'Alexandria et de Russie à la sainte Église Catholique* appeared in 1599. In 1605 he took part in founding the colony of Acadia and that of Port Royal, and in 1609 published the *Histoire de la nouvelle France*, and a collection of poems, entitled *Les muses de la nouvelle France*. The history embraced a sketch of Cartier's voyages, the French settlement of Florida, and of Canadian colonization. It went through three editions; the last, with addition of other works, was published in 1618. The first edition was translated into English and German. Lescarbot was afterwards an advocate in the French parliament and the author of several unimportant works.

LES'GHIANS, a body of 300,000 people, inhabiting the mountains of western Daghestan in the Caucasus (Asiatic Russia), and speaking various languages. For many years they made a brave resistance to Russian aggression. Since 1859 they have been peaceable. Their religion, a modification of Islamism, is called Muradism, and was founded about 1830 by a native prophet.

LESION, a term in Scotch law to denote injury or prejudice sustained by a minor or by a person of weak capacity, sufficient to be a ground of action to reduce or set aside the deed which caused the lesion. See INFANT.

LESLEY, JOHN, 1527–96; b. Scotland; educated at King's college, Aberdeen, and in several continental universities, and in 1554 became professor of common law at Aberdeen. He was a partisan of Mary, queen of Scots, who made him bishop of Russ. He was also her diplomatic agent, and implicated in her project for marrying the duke of Norfolk as well as in the resulting rebellion of 1568. In 1573, in her service and for the promotion of Roman Catholic interests, he went to France, where he received ecclesiastical appointments, being made bishop of Coutances in 1593. Soon after this he was compelled to flee for refuge to Brussels, where he died. He wrote much in support of the cause of his royal mistress, and published in Rome, 1578, a *History of Scotland*, in 10 books, seven in Latin, and the last three in the Scottish dialect.

LESLEY, JOHN PETER, b. in Phila., 1819; graduated at the university of Pennsylvania in 1838, and at Princeton theological seminary in 1844. He assisted in the first geological survey of Pennsylvania, 1839–41, and prepared the maps and illustrations for the final report in 1842. After completing this work he went to Europe, traveled on foot through France, and attended lectures at the university of Halle. In 1845 he undertook to establish the colportage system of the American tract society in the northern and middle counties of Pennsylvania. Two years later he became pastor of a Congregational church at Milton, Mass., but left the ministry in 1850 for the work of a professional geologist. Settling in Philadelphia, he was appointed secretary of the American iron association in 1855, secretary and librarian of the American philosophical association in 1858, professor of geology and mining engineering in the university of Pennsylvania in 1873, and state geologist of Pennsylvania in 1874. He examined the Bessemer iron-works of Europe in 1863; was appointed by the U. S. senate commissioner to the exposition of 1867, and spent the following season in Egypt. Among his works are a *Manual of Coal and its Topography*, and a *Guide to the Iron-Works of the United States*.

LESLIE, CHARLES, 1650–1722; b. Ireland; graduated at Trinity college, Dublin; removed to England in 1671 and began the study of law at the Temple, but soon abandoned this for divinity, and was admitted to orders in the church of England in 1680. Returning to Ireland he was appointed in 1687 chancellor of Connor. Living in Ireland at the time of the revolution he distinguished himself in disputations with the Roman Catholics in defense of Protestantism. Though a zealous Protestant he adhered to king James, refusing to acknowledge William as his rightful sovereign. Deprived of

prospect of preferment in the church, he left Ireland and came to England, where he gave himself to ecclesiastical and political controversy. In 1689 he had a controversy with bishop Burnet in defense of the doctrine of non-resistance. After the death of James II. he transferred his allegiance to his son, the pretender, was sent by some opulent Jacobite gentlemen in 1709 to Bar-le-Duc to convert him, and when the pretender removed to Italy he accompanied him. But being a Protestant he was dissatisfied with his inconsistent position, and in 1721 sought and obtained permission from George I. to return to his native land, and took up his abode at Glaslough, Ireland. His theological works excited much attention at the time. The most prominent are: *A View of the Times—their Principles and Practices; The Massacre of Glencoe; The Axe laid to the Root of Christianity; Querel a Temporum; A Short and Easy Method with the Deists.* He wrote against Quakers, Presbyterians, Deists, Jews, Socinians, and Papists. In his political controversies he was the advocate of high monarchical principles. Leslie is declared to have been a man of great learning and strict piety.

LESLIE, CHARLES ROBERT, R.A. This distinguished artist was b. in London in 1794. His parents were Americans resident there at the time of his birth; they went back to America in 1799, taking with them Charles Robert along with their other children. His father died in 1804 leaving the family in straitened circumstances. Young Leslie having from infancy been fond of drawing, wished to be a painter; but his mother not having the means of giving him a painter's education, he was bound apprentice to Messrs. Bradford & Inskeep, booksellers and publishers in Philadelphia. He had been three years at his apprenticeship, when he managed to execute a drawing of the popular actor, George Frederick Cook. The likeness having been pronounced excellent by a number of connoisseurs, a subscription was raised to enable the rising artist to study painting two years in Europe. He accordingly returned to England in 1811, and entered as a student in the royal academy. He seems at first to have attempted subjects in what is called the classical style, together with portraits; but by degrees he came to follow out the bent of his genius, and turn his attention to works in that style in which he distinguished himself—viz., genre-painting of the highest class. The first picture that brought him into notice was "Sir Roger de Coverley going to Church," exhibited in the royal academy in 1819. In 1821 his picture of "May-day in the Reign of Queen Elizabeth" secured his election as an associate of the academy; and "Sancho Panza and the Duchess," painted for lord Egremont and exhibited in 1824, his best work (of which there is a repetition among the paintings of the British school bequeathed by Mr. Vernon to the national gallery), obtained for him the rank of academician. After this, till near the period of his death, there were few exhibitions of the royal academy to which Leslie did not contribute. Leslie's principal pictures are embodiments of scenes from the works of many of the most popular authors—Shakespeare, Cervantes, Lessing, Molière, Addison, Sterne, Fielding, and Smollett. His works have had a great influence on the English school; and though he almost always executed repetitions of his principal works—a practice that generally leads to decrease the value of pictures—his pictures bring immense prices. Great power of expression and a delicate perception of female beauty are the leading points in Leslie's pictures. In the early part of his career, his style may be objected to as deficient in color, and rather dry and hard; but the influence of Newton, his talented compatriot, led him to direct his attention to the works of the Venetian masters, and impart greater richness to his coloring. Later in life, the example of Constable inclined him to strive at producing *empasto*, or fullness of surface, in his pictures. Leslie accepted the appointment of professor of drawing at the military academy of West Point, N. Y.; but he gave up this occupation after a five months' residence, and returned to England. In 1848 he was elected professor of painting at the royal academy, but resigned in 1851. He died in London in May, 1859. His lectures were published in 1845 under the title of *A Handbook for Young Painters*—a very sound and most useful work on art. A most able life of his intimate friend and brother artist, Constable, whose great talent he was the first fully to appreciate, was published by him in 1845. The *Autobiographical Recollections of Leslie*, edited by Tom Taylor (1860), is a very interesting book.

LESLIE, ELIZA, 1787-1858, b. Philadelphia. She spent seven years, 1793-1800, with her parents in Europe. Her first appearance as an author was in *Seventy-five Receipts for Pastry, Cakes, and Sweetmeats*, published in 1827. Her other publications are: *The American Girl's Book; Mrs. Washington Potts*—a tale; *Domestic Cookery Book; House-Book; Ladies' Receipt Book*; and a novel entitled *Amelia, or a Young Lady's Vicissitudes*.

LESLIE, FRANK, 1821-80; b. England; was the son of Joseph Carter, a glove-manufacturer of Ipswich, and was named Henry Carter, a name which he changed on his removal to the United States, adopting that by which he was more generally known and under which he did business, by sanction of the legislature of New York. The name "Frank Leslie" had been employed by him as a pseudonym when, as a boy, he first practiced wood-engraving, and afterwards when he was attached to the engraving department of the *London Illustrated News*. Mr. Leslie emigrated to America in 1848, and was engaged by Gleason and Ballou, who were the first to found an illustrated newspaper in this country. Their paper was published in Boston, where Mr. Leslie remained until 1853, when he removed to New York to join the staff of Mr. P. T. Bar-

num, who, in company with Moses Y. Beach, at that time started the *Illustrated News* of that city. During the first years of his newspaper experience in America, Mr. Leslie introduced an important improvement in printing from blocks through the system of "overlaid," as it is termed, a process which effectually brings out the best qualities of an impression, and which is now generally adopted wherever illustrations are printed. In 1854 Mr. Leslie commenced the publication of the *Gazette of Fashion*, which proved to be the foundation of one of the largest publishing houses in the world; issuing at one time seventeen different periodical publications, all illustrated, many of which obtained world-wide celebrity. Mr. Leslie may be said to have created the modern idea of illustrated journalism, by first giving pictorial representations of important occurrences and events, with a just perception of the value of rapidity as well as accuracy of execution in their delineation. The list of his publications included *Frank Leslie's Illustrated Newspaper*, *The Chimney Corner*, *The Lady's Magazine*, *The Popular Monthly*, *The Sunday Magazine*, etc.

LESLIE, GEORGE DUNLOP, b. London, 1835; son of Charles Robert Leslie; in his boyhood attended the Mercers' school; received artistic instruction from his father and at a school of art in Bloomsbury, and was admitted as a student to the royal academy in 1854. He began to exhibit pictures at the academy in 1857, was made an associate in 1868, and has since attained eminence in his art.

LESLIE, HENRY DAVID, b. London, 1822; studied music under the direction of prof. C. Lucas, and founded a choral society in 1856. In 1864 he became principal of the college of music, founded in the same year in London. His work has taken the form of symphonies, overtures, oratorios, cantatas, anthems, songs, duets, and pieces for the piano. He has also composed a romantic opera in three acts.

LESLIE, Sir JOHN, a celebrated natural philosopher, was b. in Largo, Fife, April 16, 1766. While a boy, showing a strong bias for the exact sciences, he was sent to St. Andrews university in 1779. In 1785 he entered the Edinburgh divinity hall, but devoted most of his time to the sciences, particularly chemistry. In 1788 he left Edinburgh, and after being two years in America, as tutor to the sons of a Virginian planter, he returned to London in 1790. From that time till 1805 he was employed as tutor to the family of Mr. Wedgwood, at Etruria, Staffordshire, in traveling on the continent, in contributing to the press, and in making experimental researches: the fruits of his labors were a translation of Buffon's *Natural History of Birds* (1793), the invention of a differential thermometer, a hygrometer, and a photometer, and the publication of an *Experimental Inquiry into the Nature and Propagation of Heat* (1804), a most ingenious work, constituting an era in the history of that branch of physical science, and for which the royal society awarded him the Rumford medals. In Mar., 1805, he was, after a great deal of opposition from the Edinburgh clergy, elected professor of mathematics in the university of Edinburgh, and soon after commenced the publication of his *Course of Mathematics*. In 1810 Leslie invented the process of artificial congelation, performed the experiment in the following year before the royal society of London, and in 1813 published a full explanation of his views on the subject; subsequently he discovered a mode of freezing mercury. In 1819 he was transferred to the chair of natural philosophy, a position better adapted to his peculiar genius, and in 1823 published one volume of *Elements of Natural Philosophy*, never completed. In 1832 he was created a knight of the Guelphic order; and on Nov. 3 of the same year expired at Coates, a small estate which he had purchased near Largo. Besides the instruments above mentioned, he invented an aethrioscope, pyroscope, and atmometer, and contributed many articles to various periodicals on heat, light, meteorology, the theory of compression, electricity, atmospheric pressure, etc. His last important work was his discourse on the *Progress of Mathematical and Physical Science during the Eighteenth Century*, which constitutes the fifth dissertation in the first volume of the *Encyclopædia Britannica*, 7th and 8th editions.

LESLIE, LESLY, or LESLEY, THE FAMILY OF. The first trace of this Scottish historical house is found between the years 1171 and 1199, when David, earl of Huntington and the Garioch, brother of king William the lion, granted a charter to Malcolm, the son of Bartholf, of the land of Lesslyn (now written Leslie), a wild pastoral parish in Aberdeenshire. Bartholf's descendants, taking their surname from their lands of Leslie, acquired large domains before the end of the 13th c., by marriages with the heiress of Rothes on the Spey, and with one of the co-heiresses of Abernethy on the Tay. Sir Andrew of Leslie appears as one of the magnates of Scotland in 1320, and from this time the family figures in the history of the country.

EARLS AND DUKE OF ROTHES.—It became ennobled in 1457, when George of Leslie, of Rothes, and of Leslie upon Leven (the family had transferred the name of its first possession in the Garioch to the lands of Fethkil, in Fife) was made earl of Rothes and lord Leslie. The third earl was the father of Norman Leslie, master of Rothes, the chief actor in the murder of cardinal Beaton. The fifth earl, although a man of dissolute life, distinguished himself as one of the ablest of the covenanting leaders. His son, scarcely less able, though almost uneducated, became lord chancellor of Scotland in 1667, and in 1680 was created duke of Rothes, marquis of Ballinbreich, earl of Leslie, etc. These honors, being limited to the heirs-male of his body, became extinct upon

his death without male issue in 1681. The earldom of Rothes went to his eldest daughter, whose descendant, the present countess of Rothes, is the 16th who has held the dignity.

EARLS OF LEVEN.—Before the family forsook its first seat in Aberdeenshire, it had thrown off branches, some of which still flourish there. The chief, that of Balquhain, has given birth by itself or by its offshoots to several men of mark, such as the learned John Leslie, bishop of Ross (born in 1527, died in 1569), the devoted champion of Mary, queen of Scots; sir Alexander Leslie of Auchintoul, a gen. in the Muscovite service, who died governor of Smolensko in 1663; and Charles Leslie, chancellor of the diocese of Connor, author of a *Short Method with the Deists*, who died in 1732. A still more distinguished man was Alexander Leslie, a soldier of fortune, who, bursting the trammels of illegitimate birth and a scanty education (he could write his name, but nothing more), rose to be a field-marshall of Sweden under the great Gustavus Adolphus. He was recalled to Scotland in 1639, to take the command of the covenanting army; and in 1641 was made earl of Leven and lord Balgony. He died in 1661, leaving two grandchildren, the younger of whom married the earl of Melville, and left a son, who became third earl of Leven and second earl of Melville. His descendant is now ninth earl of Leven and eighth earl of Melville.

LORDS LINDORES.—The second son of the fifth earl of Rothes was created lord Lindores in 1600. The title has been dormant since the death of the seventh lord in 1775.

LORDS NEWARK.—David Leslie, fifth son of the first lord Lindores, served with distinction under Gustavus Adolphus of Sweden, and returning to Scotland, on the outbreak of the great civil war, was one of the leaders of the parliamentary army at Marston moor, and surprised and routed Montrose at Philiphaugh. He was defeated by Cromwell at Dunbar in 1650, and after ten years' imprisonment in the Tower, was set at liberty at the restoration. He was made lord Newark in 1661, and died in 1682. The title has been dormant since the death of his great-grandson, the fourth lord, in 1791.

COUNTS LESLIE.—Walter Leslie, a younger son of the house of Balquhain, distinguished himself in the Austrian army, and in 1637 was created a count of the empire, as a reward for his services in the murder of Wallenstein. He died without issue in 1667, when he was succeeded by his nephew, James, a field-marshall in the Austrian service, who died in 1694. The title became extinct in 1844.

The history of the Leslies was written by father William Aloysius Leslie, a younger brother of the second count, in a large and sumptuous folio published at Gratz in 1692, with the title of *Laurus Lesliana Explicata*. The *Pedigree of the Family of Leslie of Balquhain* was printed at Bakewell in 1861, for private circulation. Some histories of the family still remain in MS. One of them boasts that "at one time three Leslies were generals of armies in three kingdoms—Walter, count Leslie, in Germany; Alexander Leslie, earl of Leven, in Scotland; and sir Alexander Leslie of Auchintoul, in Muscovy." See also *Historical Records of the Family of Leslie*, by col. Leslie of Balquhain (Edinburgh, 1869).

LESSEE—LESSOR. See LANDLORD and TENANT.

LESSEPS, FERDINAND, Viscomte de; b Versailles, France, 1805. His father was consul or commercial agent of the French government, in many different countries. His mother was sister of the grandmother of the empress Eugénie. De Lesseps was educated in Paris; at the age of 20 was an *attaché* of the French consul-general at Lisbon; at 22 was employed in the commercial department of the minister of foreign affairs, and soon after made consul at Tunis; at 26 he went to Egypt as vice-consul at Cairo, and had the management of the business of the consulate-general at Alexandria. His noble conduct during the plague in Egypt which, in 1834–5, destroyed one-third of the population, procured him in 1836 the cross of *chevalier de la légion d'honneur*. He was again made manager of the Egyptian consulate and diplomatic agent of France, and gained influence with Mehemet Ali the great viceroy of Egypt. In 1838, '39, and '42, he was appointed successively to the positions of consul at Rotterdam, Malaga, and Barcelona. When the latter city was bombarded, his devotion to the safety and comfort of the foreign residents procured him their gratitude, and thanks and decorations from several governments. He remained consul-general at Barcelona until the revolution of 1848. Then, recalled to Paris, he was appointed by Lamartine minister to Madrid. In Feb., 1849, this place was given to Napoleon Joseph Bonaparte, and Lesseps returned to Paris. He was at once sent as minister to Switzerland; but on the breaking out of war at Rome between the French troops under Oudinot, and the Italians under Garibaldi, he was charged by M. Drouyn de Lhuys with the delicate mission of restraining the French general from a too warlike attitude towards the Italians, while managing to retain the footing of the French army in Rome. During that discreditable meddling of the French with the affairs of the people of Rome, M. de Lesseps frankly informed his government of the mischievous consequences that might result from its enforced occupation of the city, of the unpopularity of the pontifical power, and of the earnestness of the resistance of the Roman people; avowing with courage his belief in the noble character and aims of Mazzini. The government in Paris, already become reactionary by the combination between Louis Napoleon and the clergy, recalled Lesseps, disavowed his acts, and let loose the French army against the Romans. He published in 1849 a little book entitled

Ma Mission à Rome, in which he defended his acts and avowed sympathy with the Italians in their struggle under the leadership of Garibaldi and Mazzini. Towards Mazzini, then defeated, banished, and proscribed by the French power in Rome, he had the courage to express the warmest admiration of his virtues and talents. The French minister charged the council of state to examine M. de Lesseps's acts in Rome, but in the absence of specific charges, the latter refused to make any explanation to them, but published his defense in two books entitled, *Mémoire au Conseil d'Etat*, and *Une réponse à l'Examen de ses Actes*.

Out of government employ, M. de Lesseps went to Egypt in 1854, and securing the concurrence of the viceroy Mohammed-Said-Pacha, projected the construction of the great interoceanic canal of Suez. In 1856 he published his plans and projects under the title of *Percement de l'isthme de Suez, exposé et document officiels*. Obstacles multiplied as attention was attracted to the project. The Turkish government, at the instigation of the English, refused its authorization. The engineer authorized by the state condemned the project as chimerical. In the face of such obstructions, and with the need of enormous sums of money to construct the canal, M. de Lesseps devoted himself to the work with such tact and indomitable energy, by social persuasion, personal interviews with statesmen, capitalists, and journalists, by essays and speeches, that he not only kept the public curiosity aroused, but attracted its sympathy and confidence; won the government to his support, and secured \$40,000,000 in subscription to the capital stock required for the construction. Work was actually commenced in 1859. On Nov. 20, 1869, the completion was celebrated with imposing ceremonies.

In Sept., 1870, on the fall of Louis Napoleon, he was in Paris, and fearing for the safety of his relative, the empress Eugénie, he placed himself at her side, and saw her safely beyond the city. In addition to numerous brochures on the subject of the Suez canal M. de Lesseps is author of a *Mémoire à l'Academie des Sciences sur le Nil blanc et le Soudan*; also *Principaux faits de l'Histoire d'Abysinie*.

The connection of M. de Lesseps with the project of an interoceanic canal, across the isthmus of Pañama is recent. An international society, for cutting an interoceanic canal through that isthmus, was organized in Paris in 1876; in which lieut. Wyse, of the French navy, and gen. Turr were the leading spirits. That society procured from the government of the United States of Colombia a concession or right to build a canal on its territory. M. de Lesseps secured to himself the privileges and assumed the conditions of that grant. Although the U. S. government (of North America) had spent several hundred thousand dollars in making thorough surveys of several canal routes, and had published elaborate illustrated reports of its engineers, no national, international, or private organization for the construction of the canal had been effected before M. de Lesseps took steps to convene the international congress of Paris for that purpose in May, 1879. De Lesseps was its president. That congress, after examining all the projects, decided in favor of the plan of a sea-level thorough-cut. De Lesseps was made president of a preliminary organization to make further surveys on the route selected. On Dec. 6, 1879, he went with his family to the isthmus. In the Jan. number of the *North American Review* of 1880, De Lesseps contributed what may be considered a talk to the American people on the canal question. In the Feb. number following, rear-admiral Ammen, who has been engaged many years in studying the canal routes, and who was one of the U. S. delegates to the Paris congress, reviewed M. de Lesseps's statements in a vein of polished satire indicating some irritation at the assumption of the latter. On Feb. 24, 1880, M. de Lesseps came from Aspinwall to New York with his family, with his project matured, and submitted it to American capitalists in a circular of information concerning the canal grant, cost, etc.; and visited Washington, Chicago, and San Francisco, in furtherance of his scheme. Having been the organizer, he is now the president of a company for the construction of a ship-canal across the isthmus of Panama.

The appearance and personal magnetism of M. de Lesseps are remarkable. A correspondent of the *N. Y. Tribune*, writing in June, 1880, gives the following description of him as seen at a dinner party given by Cyrus W. Field in London: "The shrewdest and most powerful of all the faces belonged to M. de Lesseps. I saw him at the opening of the Suez canal in 1869." Now, in his 75th year, "he is just as erect in figure, and alert in manner; his eyes are as bright and full, and his conversation has all the old power and vivacity." The *N. Y. Times* correspondent who met him on his arrival from Aspinwall, thus describes him: "In conversation, Lesseps is frank, eloquent, and kind, to a remarkable degree; and his age and white hairs are forgotten in the presence of his demonstrative gestures and his vigorous diction."

M. de Lesseps married a second wife soon after the completion of the Suez canal, a young creole lady, by whom he has a family of young children. He has also children by a former wife. See INTEROCEANIC SHIP CANAL.

LESSING, GOTTHOLD EPHRAIM, an illustrious German author and literary reformer, was b. Jan. 22, 1729, at Kamenz, in Saxon Upper Lusatia, where his father was a clergyman of the highest orthodox Lutheran school. After spending five years at a school in Meissen, where he worked very hard, he proceeded to the university of Leipsic in 1746, with the intention of studying theology. But he soon began to occupy himself with

other matters, made the acquaintance of actors, contracted a great fondness for dramatic entertainments, and set about the composition of dramatic pieces and Anacreontic poems. This sort of life pained his severe relatives, who pronounced it "sinful," and for a short time Lessing went home; but it was his destiny to revive the national character of German literature; and after one or two literary ventures at Leipsic of a trifling character, he proceeded to Berlin in 1750, where he commenced to publish, in conjunction with his friend Mylius, a quarterly, entitled *Beiträge zur Historie und Aufnahme des Theaters*, which only went the length of four numbers. About this time also appeared his collection of little poems, entitled *Kleinigkeiten*. After a brief residence at Wittenberg, in compliance, once more, with the wishes of his parents, he returned to Berlin in 1753, and in 1755 produced his *Miss Sara Sampson*, the first specimen of *bourgeoisie* tragedy in Germany, which, in spite of some hostile criticism, became very popular. Lessing now formed valuable literary friendships with Gleim, Ramler, Nicolai, Moses Mendelssohn, and others. In company with the last two, he started (1757) the *Bibliothek der Schönen Wissenschaften*, the best literary journal of its time, and still valuable for its clear natural criticism; he also wrote his *Fabeln*, his *Literaturbriefe*, and a variety of miscellaneous articles on literature and aesthetics. Between 1760 and 1765 he lived at Breslau as secretary to gen. Tauenzien, governor of Silesia. The year after his return to Berlin, he published his masterpiece, the *Laocoön*, perhaps the finest and most classical treatise on aesthetic criticism in the German or any other language. In 1767 appeared *Minna von Barnhelm*, a national drama, hardly less celebrated than the *Laocoön*; and in 1768, his *Dramaturgie*, a work which exercised a powerful influence on the controversy between the French and the English styles of dramatic art—i.e., between the artificial and the natural, between the conventional and the true, between shallow and pompous rhetoric, and genuine human emotion. In 1770 Lessing was appointed keeper of the Wolfenbüttel library. Two years later appeared his *Emilia Galotti*; and between 1774 and 1778, the far-famed *Wolfenbüttelsche Fragmente eines Unbenannten*. These Wolfenbüttel fragments are now known to have been the composition of Reimarus (q.v.), but the odium of their authorship fell at the time on Lessing, and he was involved in much bitter controversy. In 1779 he published his *Nathan der Weise*, a dramatic exposition of his religious opinions (his friend Moses Mendelssohn is said to have been the original of Nathan); and in 1780 his *Erziehung des Menschengeschlechts*, a work which is the germ of Herder's and all later works on the Education of the Human Race. He died Feb. 15, 1781. Lessing is one of the greatest names in German literature. If his works seem hardly equal to his fame, it is because he sacrificed his own genius, as it were, for the sake of others. When he appeared, the literature of his country was corrupted and enslaved by French influences. The aim of Lessing was to reinvigorate and emancipate the national thought and taste; and the splendid outburst of national genius that followed was in a large measure the result of his labors. See Stahr's *Lessing* (1859); Sime's *Lessing: his Life and Works* (1877); and Miss Zimmern's *Lessing* (1878).

LESSING, KARL FRIEDRICH, b. Wartenberg, Silesia, 1808; attended the school of architecture at Berlin; afterwards studied for several years under Schadow at Düsseldorf, and in 1858 was made director of the gallery of paintings at Carlsruhe. Many of his pictures have excited admiration by their strength and richness. Among the best known of his historical paintings are "The Hussites;" "Huss before the Council;" and "The Martyrdom of Huss."

LESSON (Lat. *lectio*, Fr. *leçon*, a reading, called by the Greeks *anagnosma*), in liturgical literature, means a portion of the church service appointed to be read, chiefly with a view to instruction and exhortation, not couched in the form of a prayer, nor, even when found in the mass or the communion service, directly bearing upon the consecration of the eucharistic elements. The lessons of the eucharistic service in the Roman Catholic church are always taken from the books of the Old or New Testament (including the apocrypha); but in some of the other services of the Roman, Greek, and oriental churches, portions of the writings of the fathers, lives of saints, and occasionally short narratives from church history, are employed. The very earliest notices which we have of the liturgical services of the first Christians allude to the usage of reading portions of sacred Scripture publicly in the church. The practice existed among the Jews in their synagogues (Luke iv. 16), and St. Paul frequently alludes to its use also in Christian assemblies, in his epistles to the infant churches of Colossæ, Laodicea, and Thessalonica. It is even more circumstantially referred to by Tertullian (*Apolog.* c. 39; and again, *Prescript.* c. 36), and by Justin the martyr in his *Apology* (1 *Apol.* n. 67). Our information regarding the liturgy of this early period is too scanty to enable us to say what order was followed, and what principles were adopted in selecting the portions of Scripture for these solemn readings; but from the fathers of the 4th and later centuries, it is plain that the selection was in some degree regulated by the seasons; and, at all events, that it was not left to the determination of each individual minister or even church. It would seem that in general the extracts were so disposed as to present the several books of Scripture in succession; but at particular times, portions were chosen which seemed appropriate to these times. Thus, the lessons at and after Easter were the gospel narratives of the resurrection; between Easter and Pentecost, the Acts of the Apostles; in Lent, they were taken from Genesis and the other books of the Pentateuch;

in Passion-tide, from the book of Job. In the modern Greek church, so strictly is this order observed, that the Sundays of certain periods are known by the names of the Evangelists read at that time—as the first, second, or third “Matthew-Sunday,” “Mark-Sunday,” etc. In the Roman missal, the distribution of the gospel lessons is regulated more by the subjects than by the authors; and in addition to the distribution according to time, there is another which is regulated by the nature of the festivals, or the special characteristics of the saints to whose offices they are appropriated. The time and the origin of this distribution are uncertain; but it is commonly ascribed, at least in part, to St. Jerome, and distinct traces of it are found in several writers of the 5th and following centuries.

In the service-books of the Roman Catholic church, the lessons of the missal are always from holy Scripture; and they are, unless in a few exceptional cases, two in number, the first called (as being ordinarily taken from one of the epistles of St. Paul, or the canonical epistles) the “Epistle”; the other, the “Gospel.” A second gospel is commonly read, which is taken from the 1st chapter of St. John. The epistle is taken either from the canonical epistles of the New Testament, or, less frequently, from one of the books of the Old Testament, including the apocrypha (generally from Wisdom, Ecclesiastes, Ecclesiasticus, or Proverbs), but occasionally from the books of the Pentateuch and other historical books. On a few exceptional occasions, chiefly in advent and lent, or at the quarter tenses (as the ember-days are named in the language of the Roman church calendar), more than one epistle occurs. The distinction of the “Epistle Lesson” and the “Gospel Lesson” is at least as ancient as the time of St. Augustine (see Aug. Serm. 176). In the solemn or high mass, each of these lessons is chanted or recited by a separate minister—the epistle by the sub-deacon, the gospel by the deacon; the former being chanted at the right side, the latter at the left side of the altar. In the low mass, both are read by the priest; but the same difference of position in reciting them is observed by the single priest. Anciently, one or both were chanted from an elevated platform or pulpit called *ambo*, and in Gothic churches, from a gallery attached to the rood screen. The recitation from the ambo is retained in the Ambrosian rite as still practiced in the Milan cathedral. In the several eastern rites, the lessons are more numerous than those corresponding to the Roman epistle, being chosen from the Old Testament, from the Acts of the Apostles, from St. Paul’s epistles, and from the Catholic epistles. The gospel-lessons are, of course, taken from the several Evangelists. In the Greek church, the former is read by the *anagnostes* or *lector*; the latter by the deacon. In the other eastern churches, both are read by the deacon, with the exception of the Syrian church, in which the gospel is read, not by the deacon, but by the priest.

The “lessons” of the Roman breviary are more varied. They occur only in matins, with the exception of a “short lesson,” which is found in Prime and also in Compline. The lessons of matins are sometimes three, sometimes nine in number, according as the matins consist of one or of three “nocturns.” See BREVIARY. When there are three nocturns, the lessons of the first are commonly from the Holy Scriptures, the books of which are so distributed throughout the seasons, that portions of every book shall be read during the year. The lessons of the second nocturn consist either of a narrative of the life of a saint, or of the circumstances of a festival, or of a sermon or other discourse from a holy father; and those of the third are generally from a homily of one of the fathers upon the gospel appropriate to the festival. The “short lessons” of Prime and Compline consist of sentences from Holy Scripture.

In the public and solemn offices, the lessons are chanted, the tones being reputed of ancient origin; and the chanting of the gospel especially being accompanied with special marks of reverence for the word of God, as the incensation of the book of the gospel, signing it with the sign of the cross, and the bearing of lights during the singing—a practice which was already ancient as early as the days of St. Jerome’s controversy with Vigilantius. When the pope officiates solemnly, the epistle and gospel are chanted in Greek as well as in Latin, in order to denote the union of both the rites in one Catholic church; and at the coronation of at least one of the popes (Alexander V.), the gospel was sung in Latin, Greek, and Hebrew.

In the church of England the term is used only of the portions of Scripture appointed to be read at morning and evening prayer, and at the service for the burial of the dead. The enlargement of this part of the service formed a great feature of the reformed liturgy, and was a return to the more ancient use, entire chapters being substituted for short selected passages. Four lessons are appointed for every day, two at morning and two at evening prayer. The first lesson, at each service, is taken from the Old Testament—which is read through, in course, once a year (the order of the books being only departed from in the reservation of Isaiah for the season of advent)—and from certain books of the Apocrypha, viz., Tobit, Judith, Wisdom, Ecclesiasticus, Baruch, and the histories of Susanna and of Bel and the Dragon, which are read for the reasons quoted from St. Jerome, in the sixth article of religion, viz., “for example of life and instruction of manners,” but not “to establish any doctrine.” The second lessons are from the New Testament, which is read through three times in the year—that in the morning from the gospels and acts of the apostles, that in the evening from the epistles. “Proper,” i.e., special first lessons, are appointed for all Sundays and holidays; those for Sundays were fixed at the restoration of the reformed liturgy under Elizabeth, and

consist of chapters selected from the various books, so arranged as to follow the seasons of the church—e.g., those during Advent are taken from Isaiah, those from Septuagesima to Easter from Genesis and Exodus, so that the account of the institution of the Passover and the going out from Egypt falls on Easter day. The general purpose of the Sunday proper lessons seems to be that of representing the divine dealings with the church of the Old Testament. The first lessons, on the minor holy-days, are taken, in course, from the didactic books of the Old Testament and Apocrypha. Except on the chief festivals, there are no proper *second* lessons, the New Testament being ordinarily read through, in course, on Sundays and week-days, so causing the fixed first lesson to combine with the varying second lesson, in a manner which sometimes throws much light on both. Parts of Leviticus and Joshua, and the two books of Chronicles, are omitted; and the Apocalypse is resorted to only to supply the second lessons for the feast of St. John the Evangelist, and at evening service on All Saints' day. The lessons for each service are ascertained by reference to a calendar, prefixed to the book of common prayer—the proper lessons, which always supersede the others, being given in separate tables. When a lesson is directed to be read to any verse, it is always *exclusive* of that verse. The lessons are allowed to be read by persons not in holy orders, but are directed to be so read “as may best be heard of all present.” Each lesson is followed by a canticle or psalm, after the manner of the old responsory, and on the principle that every revelation of the divine character and dealings affords fresh material for His praise.

LESTER, CHARLES EDWARDS. b. Griswold, Conn., 1815; a descendant of Jonathan Edwards. He resided in early life at the West and South, was admitted to the bar in Mississippi, and afterwards ordained as a Presbyterian minister. In 1840, being in Massachusetts, he attended anti-slavery meetings and made several addresses in favor of the cause, and by his own request was elected a delegate by the Massachusetts anti-slavery society to the London anti-slavery conference of that year. He remained in England after the conference closed, and, having changed his views, published *The Glory and Shame of England*—a work in which the anti-slavery professions of that country were treated as hypocritical. President Tyler, in 1842, appointed him as U. S. consul to Genoa, where he remained until 1847. Since that time he has been engaged chiefly in literary labors, having published *Condition and Fate of England*; *Life of Vespuccius*; *The Napoleon Dynasty*; *Life of Charles Sumner*; and *Our First Hundred Years*.

LESTOCQ, JEAN HERMAN, 1692–1767; b. at Celle, Hanover. He chose the profession of a surgeon, and, after acquiring his education, went to Russia and received an appointment in the service of Peter the great, but on account of his dissolute habits was banished to Kazan in 1718. In 1725 Catherine I. recalled him, and appointed him surgeon to the princess Elizabeth. Such was the influence which he acquired over the princess, that he succeeded in persuading her to engage in the revolution of 1741, by which she became empress of Russia. The empress gave him a pension of 7,000 roubles annually, and the king of Poland made him a count. In 1748 his loyalty was suspected by the empress, and he was arrested, put to the torture, and banished to Ooglitch. He was recalled by Peter III. in 1761, and Catherine II. gave him an estate in Livonia, where he died.

L'ESTRANGE, Sir ROGER, 1616–1704; b. Hunstanton, Norfolk, England. After receiving a liberal education he accompanied Charles I. in his expedition against the Scots in 1639. A zealous royalist during the civil war, he was appointed by the king in 1644 governor of Lynn, and attempted to take it from the parliamentary forces, but was betrayed by two of his accomplices, tried, condemned to death as a traitor, and sent to Newgate. Having friends in parliament he was reprieved, and after four years' confinement escaped, attempted to excite an insurrection in Kent, but failing, fled to the continent. After the passage of the act of indemnity in 1652, he returned in 1653, made personal application to Cromwell, and was allowed to remain undisturbed. After the restoration he was appointed by Charles II. censor or licenser of the press. In the *Public Intelligencer*, a newspaper which he started in 1663, he slavishly supported the crown. The *Observator*, begun after the popish plot in 1679, was the organ of the tory party, and sought to defend the king from the charge of favoring popery. On the accession of James II. he was knighted for “his unshaken loyalty to the crown,” and became in 1685 a member of parliament. At the restoration in 1688 he was deprived of his office of censor, and soon after became an imbecile. His political pamphlets, which were numerous, were written in a coarse, violent, abusive style. He wrote translations of *Josephus*; *Cicero's Offices*; *Seneca's Morals*; *Erasmus's Colloquies*; *Aesop's Fables*; *Quædo's Visions*; *Bona's Guide to Eternity*; *Five Love-letters from a Nun to a Cavalier*.

LESTRIDINÆ, a name of a sub-family of *laridae*, the great family of gulls, and of course allied to the sub-family *larinæ* (q.v.). The group embraces the jägers or gull hunters, so called because they pursue the smaller gulls, and rob them of the food which they may have in their beaks or which they have swallowed, making them disgorge. They have a strong beak, the upper mandible of which hooks over the lower. The typical species are principally inhabitants of the polar regions, but some are distributed in various seas. See GULL.

LE SUEUR, a co. in s.e. Minnesota, having for its western boundary the Minnesota river, drained by Cannon river, rising in its southern portion, and flowing e., emptying into the Mississippi river; 475 sq.m.; pop. '80, 16,104—11,314 of American birth, 35 colored. Its surface is diversified by extensive forests of sugar maple, oak, elm, and ash, and a large number of picturesque lakes. Its soil, having a limestone formation, is very fertile, and adapted to the raising of tobacco, wool, sweet potatoes, wine, dairy products, maple sugar, sorghum, and hops. Lumber is a staple commodity, and it has 5 carriage factories, 6 flour-mills, and 14 saw-mills. It had in '70, 51 manufacturing establishments, employing 184 hands, with a capital of \$142,275, and a product of \$407,023. The Winona and St. Peter railroad forms its s.w. boundary, following the course of the Minnesota river, and its eastern section is crossed by the St. Paul and Sioux City railroad. Seat of justice, Le Sueur.

LESUEUR, EUSTACHE, 1617-55; b. France; a painter early patronized by cardinal Richelieu, but was long obliged to earn a scanty living by designing for books, etc. His painting of St. Paul healing the sick by the imposition of hands gave him celebrity; and a series of 19 pictures executed for the drawing-room of the Hôtel Lambert, and 22 pictures illustrating the life and death of St. Bruno, are among the works which afterwards established his fame.

LESUEUR, JEAN BAPTISTE CICÉRONE, 1794-1879; b. France; an architect who received the Roman prize at the *académie des beaux arts* in 1819, and then spent several years in Italy. In 1828-30 he designed the church of Vincennes, and was associated with Godde in the admirable extensions of the *Hôtel de Ville* of Paris. In 1852 he became a professor in the school of fine arts, and in 1857 completed the conservatory of music in Geneva. He is author of the *Chronologie des Rois d'Égypte*, which was published by order of the government in 1848-50.

LA SUEUR, JEAN FRANÇOIS, 1760-1837; b. France; a musical composer; educated at Amiens. At the age of 26 he was made chapel-master of Notre Dame in Paris; afterwards one of the examiners of the conservatory of music; in 1804 imperial chapel-master, and in 1814 royal director of music. He is author of the following operas: *La Caverne*; *Paul et Virginie*; *Télémaque*; *Les bardes*; *La mort d'Adam*; also of a large number of oratorios and sacred compositions.

LETCHER, a co. in s.e. Kentucky, surrounded by ranges of the Cumberland mountains; 360 sq.m.; pop. '80, 6,601—6,600 of American birth, 142 colored. It is drained by the head waters of the Kentucky river. The s. and s.e. section is occupied by a part of the Cumberland mountain range that separates it from the state of Virginia. It has large tracts of woodland, and bituminous coal is present in some sections. Some portions of its valleys are fertile, being adapted to the raising of live stock and every variety of grain. Seat of justice, Whitesburg.

LETHAL WEAPON, in Scotch criminal law, means a deadly weapon by which death was caused, as a sword, knife, pistol.

LE THÉ, in Grecian mythology, the stream of forgetfulness in the lower world, from which souls drank before passing into the elysian fields, that they might lose all recollection of earthly sorrows.

LETO. See LATONA.

LETRONNE, ANTOINE JEAN, 1787-1848; b. Paris; distinguished in early youth alike for his spirit in supporting his mother and brother and for precocity in classic learning. He traveled in his own country and in Switzerland, in 1810-12; then edited the work of Dicuil on the measurement of the earth. The government selected him to complete the translation of Strabo begun by Laporte-Dutheil. In 1819 he became inspector-general of the university; in 1831 professor of history in the college of France; in 1832 keeper of antiquities in the royal library; in 1838 administrator of the college of France, and professor of archaeology; and in 1840 keeper of the archives of the kingdom. His great work, left unfinished at his death, is the *Recueil des Inscriptions Grecque et Latines de l'Egypt*, two 4to volumes of which were published in Paris, 1842-48.

LETTER MISSIVE, in the usage of Congregational churches, the official letter by which churches are invited to send their delegates to a council. The form is not important; but in substance, the letter must credibly purport to be issued by the church (or in some cases the person or persons) desiring the council; must be addressed and a copy sent to each invited church; must appoint the time and place of convening; must show the names of all churches similarly summoned to compose the council; and must plainly designate the case or cases which are to be submitted for advice or action. Churches may decline to respond to the invitation conveyed by a letter missive; but when it has been issued and acted on by the invited churches in the appointment of their delegates, it becomes the charter of the council; and as such it cannot be changed either by the church which sends it or by the council convened pursuant to it, in regard to either the object or the membership which the latter has designated for the council. Thus the membership indicated by the letter missive cannot be enlarged; and the council, though it may refuse to act under the letter, cannot act at all outside of its limitations. In strict theory letter missives should summon churches only, but in practice they are often issued to individuals also.

LETTER OF MARQUE (because the sovereign allowed a market or mart—i.e., authorized the disposal of the property taken), the commission authorizing a privateer to make war upon, or seize the property of, another nation. It must be granted by the lords commissioners of the admiralty, or by the vice-admiral of a distant province. Vessels sailing under such commissions are commonly spoken of as *letters of marque*. Making war without letters of marque by a private vessel is piracy. Letters of marque were abolished among European nations at the treaty of Paris in 1856.

LETTERS, a legal term used in the United Kingdom in combination with other words. *Letters of administration* in England and Ireland mean the legal document granted by the probate court to a person who is appointed administrator to a deceased person who has died intestate. See ADMINISTRATION, WILL, INTESTACY. *Letter of attorney*, or power of attorney, in English law, is a writing or deed authorizing an agent (whether he is a certificated attorney or not) to do any lawful act in the stead of the party executing it. *Letters conform*, in Scotch law, mean a writ issued by the supreme court enforcing a decree of an inferior court. *Letter of credit* is an authority from one banker to another to pay money to a third person. *Letters of exculpation*, in Scotch criminal law, are a warrant obtained by a prisoner to summon witnesses on his behalf at his trial. *Letter of guarantee*, in Scotch law, means a writing guaranteeing a debt or engagement of another. *Letter of license* is a deed or instrument executed by the creditors of a trader who is insolvent, giving him time to pay, and, in the meantime, to carry on his business under surveillance. *Letters missive*, in England, is an order from the lord chancellor to a peer requesting the latter to enter an appearance to a bill filed in chancery against such peer; in Scotland, the word means any written agreement or memorandum relative to some bargain as to mercantile matters, or as to the sale of land or houses or the letting of land. *Letters patent* mean a writing of the queen, sealed with the great seal of Great Britain, authorizing or appointing the party to whom it is addressed to do some act, or execute some office, as creating a peer, a judge, a queen's counsel; also granting a patent right to a person who is the first inventor of some new contrivance. See PATENT. *Letters of request*, in English ecclesiastical law, mean a writ which commences a suit in the court of arches against a clergyman, instead of proceeding, in the first instance, in the consistory court. *Letters of safe conduct* mean a writ, under the great seal, to the subject of a state at war with this country, authorizing and protecting such subject while dealing or traveling in this country, so that neither he nor his goods may be seized, as they otherwise might be.

LETTERS (ante). *Letters rogatory* are an instrument sent by a judge in the name and by the authority of his court to a court in another jurisdiction, requesting the latter to have examined a witness within its jurisdiction, in regard to a cause pending in the former court, upon written interrogatories filed in said cause. The instrument is addressed to any foreign court with civil jurisdiction, relates the pendency of the cause in the home court, and the names of the witnesses residing in the foreign jurisdiction, and requests the foreign court to cause such witnesses to be examined, and their depositions to be taken and returned with the letters to the home court. Letters rogatory are not in frequent use at present; though occasionally resorted to in admiralty courts. They are necessary where a foreign government refuses to execute commissions issued to private persons, and oaths can be administered and depositions taken only by judicial officers. *Letters testamentary* are an instrument issued by a judge who has jurisdiction of probate matters, declaring that a certain will has been admitted to probate, and giving the executor power to administer the estate. Such an instrument granted to the administrator of a person dying intestate is called *letters of administration*. The original will is usually deposited in the registry of probate, and a copy, under seal, with the letters annexed, is returned to the executor or administrator. Such letters do not extend over assets of the decedent situated in another state. For such assets ancillary administrators must be appointed, to whom additional letters must issue. See EXECUTOR; PROBATE COURT; ante.

LETTERS, PROPORTIONATE USE OF. The following tables represent the conclusions based on the experience of printers, with regard to the relative frequency of use of the letters of the alphabet in English composition. The first table exhibits the general use; the second, that of initials:

E.....	1000	H.....	540	F.....	236	K.....	88
T.....	770	R.....	528	W.....	190	J.....	55
A.....	728	D.....	392	Y.....	184	Q.....	50
I.....	704	L.....	360	P.....	168	X.....	46
S.....	680	U.....	296	G.....	168	Z.....	22
O.....	672	C.....	280	V.....	158		
N.....	670	M.....	272	B.....	120		

The proportion of their use as initial letters is as follows:

S.....	1194	M.....	439	W.....	272	Q.....	58
C.....	937	F.....	388	G.....	266	K.....	47
P.....	804	I.....	377	U.....	228	Y.....	23
A.....	574	E.....	340	O.....	206	Z.....	18
T.....	571	H.....	308	V.....	172	X.....	4
D.....	505	L.....	298	N.....	153		
B.....	463	R.....	291	J.....	69		

LETTERS AND ARTICULATE SOUNDS. Letters are conventional marks or visible signs of the elemental sounds of spoken language. The earliest symbols of sounds represented syllables rather than simple sounds (see ALPHABET, HIEROGLYPHICS, CHINESE LANGUAGE). It was only gradually that syllables were reduced to their ultimate elements, and all alphabets yet bear marks of their syllabary origin (see letter K), displaying various imperfections both of excess and defect.

Articulate sounds are divided into vowels and consonants; and the latter are subdivided into voiceless and vocal elements (otherwise called "sharps" and "flats"), obstructive and continuous elements (otherwise called "mutes" and "semi-vowels"), and liquids. Many other divisions have been proposed, but the above classification embraces all real varieties. The elements are likewise classified according to the organs which form them, as labials, linguals, gutturals, nasals, etc. A physiological description of the articulate sounds used in English speech, will show the necessary extent of a perfect system of letters, and exhibit the short-comings of our present alphabet.

All the elements of speech are susceptible of separate formation; and in the following description, reference is always intended to the exact sound of each element, and not to the names of the letters.

Emitted breath mechanically modified forms every articulate sound. The breath is first modified in the throat, by a certain amount of constriction in the larynx, wanting which restraint, the air would flow out noiselessly, as in ordinary breathing, or gushingly, as in sighing. The breath is thus economized into a steady stream, and rendered audible by the degree of roughness or "asperation" it acquires when forced through a narrow aperture. This "asperated" current of air, when articulated, forms whispered speech. In passing through the larynx, the breath is further acted on by the opposing ligaments of the glottis (the aperture of the larynx), and sonorous voice is produced. The vocalized or asperated breath receives vowel and articulate modification in its passage through the mouth. When the mouth is sufficiently open to allow the breath to flow without obstruction or oral asperation, the air is molded into the various qualities of vowel-sound; and when the channel of the mouth is obstructed, or narrowed so much as to cause a degree of asperation of the breath between the tongue and the palate, the lips, etc., consonant-sounds are produced.

The upper part of the mouth is an immovable arch: all variations in the shape of the oral passage are consequently effected by the tongue and the lips. [A nasal variety of vowel-sounds occurs in French—represented by *n* after the vowel-letters. These sounds are formed by depressing the soft palate, which otherwise covers the inner end of the nostrils, and allowing part of the breath to pass through the nose, while the remainder is modified in the usual way.]

Vowels.—When the tongue is raised in its greatest convexity towards the roof of the mouth, but without being so close as to roughen or asperate the breath, the resulting vowel quality is that heard in the word *eel*; and progressively less degrees of elevation produce a series of lingual vowels, of which *Ah* is the most flattened—the lips being equally expanded throughout the series, to allow the breath to escape without labial modification.

When the aperture of the lips is contracted in the greatest degree short of asperating the breath, the resulting vowel-quality is that heard in the word *ooze*; and progressively less degrees of labial contraction form a series of labial vowels, of which *Aw* is the most open—the tongue being retracted throughout the series, to direct the breath without lingual modification forward against the lips.

A third series of vowels is formed by combining elevated positions of the tongue and contracted positions of the lips, or retracted positions of the tongue, and expanded positions of the lips. Of this labio-lingual series, the German *ü* is the most contracted, and the English sound heard in the word *err* the most open.

The following table shows the principal vowels of each class:

	Lingual.	Labio-Lingual.	Labial.
Close.....	<i>ee(l)</i>	<i>ü</i>	<i>oo(ze)</i>
Medial.....	{ <i>a(i(l))</i>	{ <i>eu</i>	{ <i>o(l)d)</i>
Open.....	{ <i>e(re)</i>	{ <i>ö</i>	{ <i>o(re)</i>
		<i>ah</i>	<i>e(rr)</i>
			<i>a(l)</i>

The possible modifications of the oral channel are endless, and untraceably minute, as are the shades of vowel-quality heard in dialects, and among individual speakers. In English, there are altogether thirteen established varieties, as heard in the words *eel*, *ill*, *ale*, *ell*, *an*, *ask*, *ah*, *err*, *up*, *all*, *ore*, *old*, *ooze*. Besides these, which a perfect alphabet must represent, we have the diphthongal sounds heard in the words *isle*, *owl*, *oil*, and the asperated compound *yoo*—the sound of the letter *u* in *use*—which is often, but erroneously, supposed to be a diphthongal vowel.

The Aspirate H.—The letter *H* (see ASPIRATE) represents an expulsive breathing, modified by the form of the vocal element which follows it—as in *he*, *hay*, *high*, *hoe*, etc., in which the *H* will be observed to have the quality of *ē*, *ā*, *ī*, *ō*, etc., but without the laryngal contraction, and consequent asperation of the breath, which forms a whispered vowel.

Consonants.—When the tongue is raised convexly against the back of the palatal arch

so as to stop the breath, the separation of the tongue from the roof or back of the mouth is accompanied by a percussive effect, which is represented in the English alphabet by C, K, and Q, and by G when the obstructed breath is vocalized. While the tongue is in this obstructive position, if the soft palate be depressed so as to uncover the inner end of the nostrils, the breath will pass through the nose. This, with vocalized breath, is the formation of the element represented in English, for lack of an alphabetic character, by the digraph *ng*.

[The percussive effect of K—G is slightly modified by the point at which the tongue leaves the palate before different vowels, as in the words *key* and *caw*; the consonant of the latter word being struck from the soft palate, and that of the former word further forward, from the hard palate. A peculiar Anglicism of pronunciation is derived from the substitution of the anterior for the posterior formation of K—G in certain words, as *kind, card, guide, guard, girl, etc.*]

When the fore-part of the tongue is raised to the front of the palate, so as to stop the breath, the separation of the tongue is accompanied by the percussive effect which is represented by T, and by D when the obstructed breath is vocalized. The uncovering of the end of the nostrils while the tongue is in this obstructive position produces, with vocalized breath, the sound represented by N.

When the lips are brought in contact (the lower lip rising to join the upper lip), their separation from the obstructive position is accompanied by the percussive effect represented by P, and by B when the obstructed breath is vocalized. The uncovering of the nares while the lips are in contact produces, with vocalized breath, the sound represented by M.

The remaining consonants are all of the continuous or non-obstructive class; the organs of articulation being so placed as merely to narrow the apertures, central or lateral, through which the breath issues with a degree of hissing or asperation.

The elevation of the base of the tongue so as to leave a narrow aperture between its center and the back-part of the palate, forms, with vocalized breath, the sound of Y initial as in *ye*. The sound of y resembles that of the vowel ē, but with the contracted aperture and resulting oral asperation of the breath essential to a consonant. The same position with voiceless breath forms the German *ch* as in *ich*—an element which is heard in English as the sound of H before ū, as in *hue*. [The Scotch guttural heard in *loch* differs from this only in the more retracted position of the tongue, which is approximated to the soft instead of the hard palate. The same position with vocalized breath produces the soft Parisian *burr*. The approximation of the concave root of the tongue to the fringe of the soft palate causes the uvula to flutter in the breath, and forms the rough Northumbrian *burr*.]

The elevation of the middle of the tongue towards the front of the palatal arch, with a narrow central passage for the breath, produces the element which, for lack of an alphabetic character, is represented by the digraph *Sh*; and the same position forms, with vocalized breath, the common element heard in *pleasure, seizure, etc.*, but which has no appropriate literal symbol in English.

The approximation of the flattened point of the tongue to the front of the mouth, so as to leave a narrow central passage between the tongue and the upper gum, forms the sound represented by S; and by Ž when the breath is vocalized.

The elevation of the tip of the tongue towards the rim of the palatal arch causes a degree of vibration of the edge of the tongue, and consequent asperation of the breath, proportioned to the degree of elevation, which is the English sound of the letter R. [R final, or before a consonant, has little or no asperation, but has almost the pure sonorousness of a vowel, as in *err, earn, etc.* The roughly trilled Scotch or Spanish R is formed by the quivering of the whole fore-part of the tongue as it is laxly approximated to the palate.]

The approximation of the lower to the upper lip, so as to leave a central aperture for the breath, produces, with vocalized breath, the sound of W initial, as in *woo*. The sound of w resembles that of the vowel oo, but with a more contracted aperture. The same position, with voiceless breath, forms the element represented, for lack of an alphabetic character, by the digraph *Wh*.

The remaining varieties of English articulate sounds are formed by forcing the breath through *lateral* apertures, instead of one central aperture.

When the fore-part of the tongue is spread against the front of the palate, and vocalized breath passes laterally over the middle of the tongue, the sound of L is heard. [The same position of the tongue forms, with voiceless breath, the sound of *Ll* in Welsh. The English L, as heard before ū (= *yoo*) is modified by convexity of the back-part of the tongue towards its position for Y, forming the sound which is represented in Smart's dictionary by L', as in *lure*, pronounced *l'oor*. A peculiar Gaelic variety of L is formed by raising the back-part of the tongue to the soft palate, and passing the voice laterally over the root of the tongue.]

When the tip of the tongue is applied to the upper teeth (or the gum), and the breath is emitted laterally over the point of the tongue, the sound of the digraph *Th* as in *thin* is heard; and, with vocalized breath, the sound of *Th* in *then*—neither of which elements is represented in our alphabet.

When the middle of the lower lip is applied to the edge of the upper teeth, and the

breath is emitted laterally between the teeth and the lip, the sound represented by F is produced; and, with vocalized breath, the sound of V.

Liquids.—The voice is so little intercepted in passing through the nostrils (forming m, n, or ng), and through the wide apertures of L, and also of R when not initial in a syllable, that the sound has almost the pure sonorousness of a vowel; and these elements have received the name of liquids, to designate their property of syllabically combining with voiceless consonants—seeming to flow into and to be absorbed by them, and losing much of their natural quantity as vocal sounds; as in *lamp*, *tense*, *tent*, *sense*, *tenth*, *ink* (= *ingk*), etc.; *milk*, *spilt*, *help*, *self*, *else*, *Welsh*, *health*, etc.; *hark*, *heart*, *harp*, *serf*, *earth*, *harsh*, *horse*, etc. The characteristic effect of the liquids will be best perceived by contrasting such words as *temse* and *Thames*, *hence* and *hens*, *else* and *ells*, *curse* and *curs*—in which the normal influence of vocal consonants on subsequent elements is manifested in the vocalizing of the sibilant in the second word of each pair.

From this review of the physiological varieties of articulate sounds, it will be evident that our alphabet of 26 letters is very imperfect, both by redundancy and deficiency. (1.) The same sounds are represented by more than one letter; as C, K, and Q; C and S; G and J. (2.) The same letter represents more than one sound; as C, which is sometimes K, and sometimes S; G, which is sometimes the vocalized form of K, and sometimes J; N, which is sometimes N, and sometimes ng; S, which is sometimes S, and sometimes Z; and Y, which is sometimes a consonant (when initial), and sometimes a vowel, sounded like the letter I. (3.) Single letters are used to represent articulate compounds; as G and J, which are sounded dzh [the voiceless form of J is represented by ch, as in *chair*]; U, which is sounded yoo; and X, which is sounded ks, and sometimes gz. (4.) The alphabet contains no characters for six of our undoubted consonant elements—viz., Wh, Th(in), Th(en), Sh, Zh, Ng. (5.) Each vowel-letter represents many sound; and the lack of seven characters to denote the excess of our vowel-sounds over the number of our vowel-letters is supplied by about sixty combinations of two or of three letters, so that the original phonetic character of the alphabet is almost entirely lost in the confusion of our orthography.

Consonants form, as it were, the bare and bony skeleton of speech; vowels give definite shape and individuality to words. Thus the consonants *sprt* constitute the common skeleton of such diverse words as *sport*—*sprt*, *sprat*—*sprite*, *spirit*, *support*, *separate*, *aspire*—*asperate*, which receive their distinct configuration and filling up from the vowel-sounds, which cover the consonant skeleton with molded elegance and variety. Consonants are thus the more stable elements of words, and their interchanges in the corresponding words of allied tongues are found to follow certain general laws dependent on the relations and affinities of letters. See GRIMM'S LAW. These relations are exhibited in the following table:

	SHUT.		OPEN.		NASAL.	
	Sharp.	Flat.	Sharp.	Flat.	Sharp.	Flat.
1. Labials	p	b	{ f wh lh	v w d'h	†	m
2. Linguals	t	d	{ sh *	z r		n
			{ ll (Welsh)	l		
3. Gutturals	k	g	{ ch (loch) ch (ich)	gr y		ng

In pronouncing the letters of the first class, the lips are chiefly concerned; in the second, the principal organ is the tongue, or the tongue and the teeth (whence they are also called *dentals*); and in the third, the back-parts of the tongue and palate are employed. But while all the sounds of each class have thus a common organic relation, the first pair differs from the other letters of the same class by being *obstructive* or shut—otherwise called *mute* (q.v.); the remaining letters, having open apertures, are *continuous* or sibilant in effect—otherwise called *asperate* (q.v.). The difference also between the members of the several pairs is of the same kind throughout; p differs from b as f does from v, or t from d, or sh from zh.

In Mr. Ellis's *Plea for Phonetic Spelling*, and Mr. Melville Bell's *Principles of Speech*, the student will find a complete development of the theory of articulate sounds. Various attempts have been made to introduce a system of phonotypes, in which each sound should be represented by one invariable character. None of the schemes comes near in success to the system of *Visible Speech* (q.v.) published by Mr. Melville Bell some years ago.

* The "sharp" or voiceless r is of frequent but unrecognized occurrence. It is heard in French, as the sound of r final after a consonant, as in *theatre*; and in Scotch, as a substitute for thr, as in *three*, pronounced *rhee*.

+ The "sharp" forms of the nasals are in constant use as interjectional sounds, as in *humph!* (pronounced 'hm!'), *'hn!* (expressive of sneering), and *'mhm!* used as an affirmative in Scotland.

LETTER-WOOD, one of the most beautiful productions of the vegetable kingdom; it is the heart-wood of a tree found sparingly in the forests of British Guiana, the *piratina guianensis* of Aublet, and the *brosimum aubletii* of Poeppig, belonging to the bread-fruit family (*artocarpaceæ*). It grows from 60 to 70 ft. high, and acquires a diameter of from 2 to 3 feet. The outer layers of wood (*alburnum*) are white and hard; the central portion, or heart-wood, which rarely exceeds 7 in. in thickness, is extremely hard and heavy, and is of a rich dark-brown color, most beautifully mottled with very deep brown, almost black spots, arranged with much greater regularity than is usually the case in the markings of wood, and bearing a slight resemblance to the thick letters of some old black-letter printing. Its scarcity and value make it an article of rare and limited application. It is used only in this country for fine veneer and inlaying work, and in Guiana for small articles of cabinet-work. The natives make bows of state of it, but are said to prefer a variety which is not mottled.

LETTIC RACE, a branch of the Slavic family, subdivided into the Lithuanian, the Prussian, and the Lettic proper. The Lithuanian has preserved certain characteristics of the Indo-European languages, some of which are identical with those of the Sanskrit. It appears to be the connecting-link between the Slavic and the other Indo-European languages, and is particularly necessary for the understanding of Slavic. This tongue is spoken among the peasantry, to the number of 200,000, in some parts of East Prussia, about the towns of Memel, Tilsit, etc.; while nearly 1,300,000 of the same people are found in Russia. The Prussian language was formerly spoken along the shores of the Baltic, between the Niemen and the Vistula, by about 2,000,000 people, but has gradually been superseded by the German. The Lettic race proper still exists in Courland, in Livonia, and on the peninsula that separates the Curische sea from the Baltic. Here the Lettic language is spoken, which bears about the same relation to the Lithuanian that the Italian does to the Latin, being a modernized dialect of the older tongue. The Lettes of Livonia, now occupying the s.w. part of the province, are naturally intelligent, and are very apt in any constructive process requiring handiwork. They make their own furniture, rude agricultural implement, and other necessaries, but have no aptitude for trade, and are not energetic. They number in Livonia between 300,000 and 400,000, and though serfs until emancipated in 1818, are now in about the same condition as the German peasantry. Both women and men ride on horseback or in sledges; their dwelling-houses have different apartments, an oven, and chimneys; differing from those of the Estonians, which have but one room and no chimney, though these also form a part of the population of Livonia. The early history of Livonia is unknown, as it was not until 1158 that any trade was opened between that country and the rest of Europe, or any information spread abroad concerning it. Germans settled there a few years later, and converted the natives to Christianity. In the earliest times Livonia belonged to Russia, paying tribute, but having its own government. During the troubles in Russia the Livonians made themselves independent, but were again brought under subjection in the time of Peter the great. The first mention of Lithuania occurs in a chronicle of A.D. 1009, and it was not until the 13th c. that the half-savage barbarians inhabiting the country were conquered by the warrior-monks sent hither by Albert, bishop of Riga. The Lithuanians remained idolaters until the end of the 14th c., their deities presiding over the seasons, elements, and particular occupations. It is to be remembered that the Lithuanians are Lettes, although their language is more ancient than the existing Lettonian, which may be said to be one of its dialects. The only existing monuments of the old Lithuanian language are a catechism in Prussian, compiled about 1545; and an Euchiridion or church-service (Königsberg, 1561). The Lettonian differs from the other Lithuanian dialects in having an admixture of Finnish words. It has been employed in the translation of the Bible, and it is honored with a professorship in the university of Dorpat.

LETTRES DE CACHET, the name given to the famous warrants of imprisonment issued by the kings of France before the revolution. All royal letters (*lettres royaux*) were either *lettres patentes* or *lettres de cachet*. The former were open, signed by the king, and countersigned by a minister, and had the great seal of state appended. Of this kind were all ordinances, grants of privilege, etc. All letters-patent were registered, or *entermated*, by the parliaments. But these checks on arbitrary power did not exist with regard to *lettres de cachet*, also called *lettres closes*, or sealed letters, which were folded up and sealed with the king's little seal (*cachet*), and by which the royal pleasure was made known to individuals or to corporations, and the administration of justice was often interfered with. The use of *lettres de cachet* became much more frequent after the accession of Louis XIV. than it had been before, and it was very common for persons to be arrested upon such warrant, and confined in the Bastile (q.v.), or some other state prison, where some of them remained for a very long time, and some for life, either because it was so intended, or, in other cases, because they were forgotten. The lieut.gen. of the police kept forms of *lettres de cachet* ready, in which it was only necessary to insert the name of the individual to be arrested. Sometimes an arrestment on *lettres de cachet* was a resource to shield criminals from justice.

LETTUCE, *Lactuca*, a genus of plants belonging to the natural order *compositæ*, sub-order *cichoraceæ*, having small flowers with imbricated bracteæ, and all the corollas ligu-

late, flatly compressed fruit, with a thread-like beak, and thread-like soft, deciduous pappus.—The GARDEN LETTUCE (*L. sativa*) is supposed to be a native of the East Indies, but is not known to exist anywhere in a wild state, and from remote antiquity has been cultivated in Europe as an esculent, and particularly as a salad. It has a leafy stem, oblong leaves, a spreading flat-topped panicle, somewhat resembling a corymb, with yellow flowers, and a fruit without margin. It is now generally cultivated in all parts of the world where the climate admits of it; and there are many varieties, all of which may, however, be regarded as sub-varieties of the COSS LETTUCE and the CABBAGE LETTUCE, the former having the leaves more oblong and upright, requiring to be tied together for blanching, the latter with rounder leaves, which spread out nearer the ground, and afterwards roll or roll together into a head like a small cabbage. The lettuce is easy of digestion, gently laxative, and moderately nutritious, and is generally eaten raw with vinegar and oil, more rarely as a boiled vegetable. The white and somewhat narcotic milky juice of the plant is inspissated, and used under the name of *lactucarium* (q.v.), or *thridace*, as an anodyne, sedative, opiate medicine. The best and most useful kind of this juice is obtained by making incisions in the flowering stems, and allowing the juice which flows to dry upon them. Lettuces are sown in gardens from time to time, that they may be obtained in good condition during the whole summer. In mild winters they may be kept ready for planting out in spring.—The other species of this genus exhibit nothing of the bland quality of the garden lettuce.—The STRONG-SCENTED LETTUCE (*L. virosa*) is distinguished by the prickly keel of the leaves, and by a black, smooth seed, with a rather broad margin. It is found in some parts of Britain. *Lactucarium* is prepared from its fresh-gathered leaves in the flowering season. The leaves have a strong and nauseous, narcotic and opium-like smell.—*L. perennis* adorns with beautiful blue flowers the stony declivities of mountains and clefts of rocks in some parts of Germany, as in the Harz, etc., but is not a native of Britain, which, however, possesses one or two other species in qualities resembling *L. virosa*.

LEUCA'DIA, the ancient name of SANTA MAURA (q.v.).

LEUCH'TENBERG. See BEAUHARNAIS.

LEU'CINE (derived from the Greek word *leucos*, white) belongs to the class of bodies to which chemists now apply the term amido-acids, and which are substances in which one equivalent of the hydrogen of the radical of an acid is replaced by one equivalent of amidogen (NH_2). The empirical formula for leucine is $\text{C}_{12}\text{H}_{13}\text{NO}_4$, while that of caproic acid (whose amido-acid it is supposed to be) is $\text{C}_{12}\text{H}_{13}\text{O}_4$. It is obvious that if for one of these twelve equivalents of hydrogen one equivalent of amidogen is substituted, the latter formula becomes $\text{C}_{12}\text{H}_{11}(\text{NH}_2)\text{O}_4$, which contains the same equivalents as the formula $\text{C}_{12}\text{H}_{13}\text{NO}_4$, but indicates more closely their mode of grouping.

Leucine is of great importance in physiological chemistry, being a constituent of most of the glandular juices of the body. Considering the sources from which it is obtained artificially, there can be no doubt that the leucine found in the body is one of the numerous products of the regressive metamorphosis of the nitrogenous tissues.

LEUCIP'PUS, the founder of the atomistic school of Grecian philosophy, and forerunner of Democritus (q.v.). Nothing is known concerning him, neither the time nor the place of his birth, nor the circumstances of his life.

LEUCIS'CUS, a genus of fresh-water fishes, of the family *cyprinidae*, containing a great number of species, among which are the roach, ide, dace, graining, chub, red-eye, minnow, etc. There are no barbels. The anal and dorsal fins are destitute of strong rays.

LEU'CITE (Gr. *λευκός*, white), a natural silicate of alumina and potash, belonging to the feldspar section. It crystallizes in the monometric system, the usual form being that of the trapezohedron; surfaces of crystals are even, without much luster. It is often found in grains. Hardness 5.5 to 6; sp. gr., 2.483 to 2.49 (Dana). It has a vitreous appearance, and a smoky gray color. Translucent to opaque. Fracture conchoidal. A specimen analyzed by Klaproth from Mt. Vesuvius gave: Silica, 53.75; alumina, 24.625; potash, 21.35 = 99.725. Another from Pompeii gave: Silica, 54.5; alumina, 23.5; potash, 19.5. Before the mouth blow-pipe flame it is infusible, except with borax or carbonate of lime, when it melts to a clear globule. On the addition of cobalt solution to the globule, and reheating, a very beautiful blue is produced. This mineral is abundant on the Rhine, near Andernach, but at Vesuvius the finest crystals are found. Some of the older lavas appear to be chiefly composed of it, especially near Rome and Albano. The leucitic lavas near Rome have been used for 2,000 years for making millstones, and such stones already formed have been found in the excavations at Pompeii. From having a form somewhat resembling a common variety of garnet it has been called white garnet. Leucite sometimes becomes changed to glassy feldspar.

LEUCKART, KARL GEORGE, FRIEDRICH RUDOLF, b. Helmstedt, Brunswick, 1823; a student of medicine and natural science under Wagner at Göttingen, and in 1850 appointed professor of zoology and comparative anatomy at the university of Giessen. His helminthological researches have attracted particular attention.

LEUCOCYTHE'MIA (derived from the Greek words *leucos*, white, *cytos*, a cell, and *hama*, blood) is a disease in which the number of white corpuscles in the blood appears

to be greatly increased, while there is a simultaneous diminution of the red corpuscles. The disease was noticed almost at the same time (in 1850) by Bennett of Edinburgh and Virchow of Würzburg; the former giving it the name standing at the beginning of the article, while the latter gave it the less expressive name of *leukemia*, or *white blood*.

The increase of the white or colorless corpuscles seems to be always accompanied, and probably preceded, by other morbid complications, of which the most frequent are enlargement of the spleen, of the liver, and of the lymphatic glands. In 19 cases, it was found that enlargement of the spleen was present in 16, enlargement of the liver in 13, and enlargement of the lymphatics in 11 instances. Hence, tumefaction of the abdomen is one of the most prominent symptoms.

The microscopic examination of a single drop of blood is sufficient to determine the nature of the disease. The causes of leucocytæmia are unknown; and although the most varied remedies have been tried, the disease is almost invariably fatal.

LEUCOL, LEUCOLINE, or QUINOLINE ($C_{18}H_7N$), is one of the compounds obtained by the distillation of coal-tar. It is also obtained by the distillation of quinine, cinchonine, or strychnine with potash. It is a colorless and strongly refracting oil, which boils at about 460° , has a specific gravity of 1.081, is insoluble in water, is soluble in alcohol and ether, and neutralizes acids, forming crystallizable salts with them. On boiling 2 parts of leucol with 3 of iodide of amyl, crystals are obtained, which, when dissolved in water, treated with an excess of ammonia, and boiled for some time, yield a resinous substance, which is readily soluble in alcohol, and furnishes a splendid blue dye.

• **LEUCOMA** (derived from the Greek word *leucos*, white) is the term applied to a white opacity of the cornea—the transparent front of the eye (q.v.). It is the result of acute inflammation, giving rise to the deposition of coagulable lymph on the surface, or between the layers of the cornea. It is sometimes reabsorbed on the cessation of the inflammation, and the cornea recovers its transparency; but in many cases it is persistent and incurable.

LEUCORRHœA (Gr. *leukos*, white, and *rheo*, I flow) is a female disease, in which the most prominent symptom is the discharge of a glairy fluid, often in a considerable quantity. For the special character of this complaint, we must refer to medical treatises; it is sufficient here to say that its general treatment consists in fomentations, the application of emollients, and in the administration of tonics and astringents.

LEUCOTHEA. See INO.

LEUCTRA, anciently, a village of Boeotia, in Greece, famous for the great victory which the Thebans under Epaminondas (q.v.) here won over the Spartan king Cleombrotus (371 B.C.), in consequence of which the influence exercised by Sparta for centuries over the whole of Greece was broken forever.

LEUK, a small t. (pop. about 1200) in the canton of Valais, Switzerland, on the right bank of the Rhone, 15 m. above Sion. It is noted in association with the baths of Leuk, situated 8 m. northward at the head of the valley of the Dala and the foot of the ascent over the Gemmi pass. At this place, which is 4,500 ft. above the sea, there is a hamlet of 600 inhabitants, and several lodging-houses and hotels for the accommodation of patients and travelers. The springs have a high temperature (120° F.), are slightly saline, chalybeate, and sulphureous, and are used both for drinking and bathing. They are chiefly useful in diseases of the skin; and one peculiarity is the length of time the patients remain in the baths—as long as 8 hours a day. For this purpose there are several apartments of 20 ft. square, in which as many as 15 or 20 persons of both sexes, clad in long woolen dresses, bathe in common; sitting up to their necks in water, they beguile the time with conversation, chess, reading the newspapers, etc. There appears to have been a bathing establishment here as early as the 12th century.

LEURET, FRANÇOIS, 1797–1851; b. Nancy, France. Being unable to complete his medical studies from want of money, he enlisted as a private soldier, and while with his regiment attended the lectures of the celebrated alienist Esquirol, and through the influence of a friend he procured a discharge from the army and a situation as an assistant in the insane asylum of Royer-Collard, at Charenton. He was soon appointed one of the house physicians of the asylum. Before graduating in medicine he published several medical essays. In 1826 he received his degree of doctor in medicine, and returned to Nancy to practice his profession, but soon went again to Paris and became Esquirol's assistant, and took the editorial charge of the *Annales d'Hygiène et de Médecine Légale*. In 1832, with two friends, he published a paper on the frequency of the pulse in the insane, and also on head measurements. In 1834 he published his celebrated *Fragments Psychologiques*. In 1840 appeared his *Traité Moral de la Folie*, a work which placed him as the compeer of the most brilliant psychologists. He was afterwards appointed director-in-chief of the Bicêtre, and published other works.

LEUTHEN, a village of Prussia, in Lower Silesia, 9 m. w. of Breslau, celebrated for the victory won there, Dec. 5, 1757, by Frederick the great, with 33,000 men, over the Austrians under prince Charles of Lorraine at the head of 92,000. The Austrians lost 7,000 killed and wounded, 21,500 prisoners, and 134 pieces of artillery; the Prussians,

3,000 killed and wounded. The result was the reconquest of the greater part of Silesia by the Prussians. Pop. 870.

LEUT'SCHAU (Hung. *Löcze*), a t. of Hungary, in the co. of Zips, 126 m. n.e. from Pesth. Leutschau has the oldest Lutheran college in Hungary. The inhabitants, three-eighths of whom are Protestants, are mostly occupied in agricultural pursuits. A peculiar kind of mead made here has a large sale not only in Hungary, but in Poland and Silesia. Pop. '69, 6,887.

LEUTZE, EMANUEL, 1816-68; b. Würtemberg. His parents emigrated in his infancy to Philadelphia. A picture which he made of an Indian gazing at the setting sun first attracted attention to his talent, and brought him orders enough to enable him to go abroad for study in 1841. At Düsseldorf he became a pupil of Lessing. His picture of "Columbus Before the Council of Salamanca," painted while in Europe, was purchased by the Düsseldorf art union of New York. In 1843, while in Munich, he completed "Columbus Before the Queen." He resided at Düsseldorf until 1859, when he returned to the United States, and was generally engaged till his death on grand paintings commemorating events in the history of the United States. The following are among the best known: "The Landing of the Norsemen in America;" "Cromwell and His Daughter;" "The Court of Queen Elizabeth;" "Henry VIII. and Anne Boleyn;" "The Iconoclast;" "Washington Crossing the Delaware;" "Washington at Monmouth;" "News from Lexington;" and "Westward the Star of Empire takes its Way." The latter is of great size, and occupies a panel over one of the grand stairways of the capitol at Washington. He died in Washington.

LÉUWENHOECK, ANTOINE VAN, 1632-1723; b. Delft, Holland; was a grinder of optical glasses, and famed for the excellence of his microscopes. Though without the advantages of a liberal education, he was induced to employ his microscopes in histological investigations, and met with great success. He refuted several errors as to physiological conditions, and made some important experiments on the brain and nervous system. He also examined and described the crystalline lens. He contributed many papers to the memoirs of the academy of sciences, and an account of some of his discoveries was published in the *Philosophical Transactions* of the royal society of London, of which he became a fellow in 1680. One of his most important investigations was that by which he discovered in 1690 that the arteries and veins were continuous. He opposed the doctrine of fermentation in the blood, and also made minute examinations of the blood globules, whose form and composition he described, advancing a theory which afterwards formed the basis of that of Boerhaave on inflammation. Queen Mary and the czar Peter the great visited him at Delft, and were charmed with the wonderful sights which they witnessed through his microscopes. His writings were collected in 1695-99, and printed in Latin (Delft, 4 vols. 4to); they were published in Delft and Leyden in Dutch; and an English translation appeared in London a century later (1798-1800). Léwenhoeck claimed the first discovery of the spermatic animalcules in 1677.

LEUZE, a t. of Belgium, in the province of Hainault, 17 m. n.w. from Mons, on the right bank of the Dender, and not many miles from its source. Dyeing, bleaching, brewing, and distilling are actively carried on; also salt-refining and the expressing of oil. Woolen and cotton hosiery and lace are manufactured. Pop. '70 about 6,100.

LE VAILLANT, FRANCOIS, a distinguished traveler and naturalist, particularly eminent as an ornithologist, was b. in 1753 at Paramaribo, in Dutch Guiana, where his father, a rich French merchant, was then French consul. When he was 10 years of age, his father returned to Europe and settled at Metz, his native place. Young Le Vaillant received a good education. Beginning as a mere sportsman, he soon became an ornithologist. In 1777 he visited Paris, and inspected the rich collections of natural history there. He was now seized with a strong desire to visit unexplored countries, and embarked, at Amsterdam, in a Dutch vessel for the cape of Good Hope. Owing to the accidents of war, which had broken out between Britain and Holland, Le Vaillant found himself at the cape with nothing but his fowling-piece, ten ducats, and the clothes he had on. He found friends, however, in some of the Dutch officials, who assisted him, and provided him with the means of carrying out his intention of South African explorations. He made two principal excursions: the first from Dec., 1781, to April, 1782, eastward, at no great distance from the coast, to the Great Fish river, whence he returned by a more northern route through mountainous regions; the second, in 1783 and 1784, northwards from Cape Town as far as the tropic of Capricorn. In both journeys, his love of adventure was sufficiently gratified, and in the second he endured hardships not inconsiderable. Finding that his health suffered from fatigue and from the climate, he wisely relinquished further projects of travel, and returned to Europe, taking up his abode in Paris, where he devoted himself to the stuffing of his collection of skins of birds and other animals, an art in which he excelled, and to the preparation of works giving an account of his travels and of his discoveries in natural history. In 1793, during the reign of terror, he was thrown into prison, and only escaped the guillotine through the fall of Robespierre. He now retired to a small property at La Noué, near Sezanne, where he chiefly resided during the remainder of his life. He died Nov. 22, 1824, at the age of 71.

Le Vaillant's chief works are his travels (*Voyage dans l'Intérieur de l'Afrique*, Paris, 1 vol. 4to, or 2 vols. 8vo, 1790; and *Second Voyage dans l'Intérieur de l'Afrique*, 2 vols. 4to, Paris, 1796), which were speedily translated into English and other languages, and are remarkable for their spirited narration of incident, and the interest with which every subject is invested; and his *Natural History of the Birds of Africa* (6 vols. 4to, Paris, 1796-1812). He published also several works on particular departments of ornithology, as a *Natural History of Paroquets*, a *Natural History of Birds of Paradise*, etc. He made many discoveries in various departments of natural history, but chiefly in ornithology.

LEVANT, THE—from the Italian *Il Levante*, the *Orient*, or *Rising*, that is, the e.—a name employed throughout the whole of Europe to designate the eastern parts of the Mediterranean sea and adjacent countries. In a wider sense, it is applied to all the regions eastward from Italy, as far as the Euphrates and the Nile; but more generally is used in a more restricted sense, as including only the coasts of Asia Minor, Syria, and Egypt.

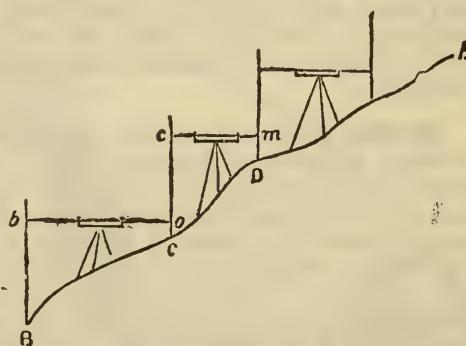

LEVANT AND COUCHANT, a phrase in English law applied to cattle which have strayed into another's lands, and have been so long there that they have lain down and slept there.

LEVA'RI FA'CIAS, WRIT OF, in English law, is a writ of execution issued upon a judgment, by which the judgment creditor takes the real and personal estate, such as lands, houses, furniture, etc., of his debtor to satisfy his debt. The mode by which this was done was by the sheriff drawing the rents and paying the creditor. The writ is now practically superseded by the writ of *elegit* (q.v.) as regards real estate, and *fieri facias* (q.v.) as regards personal estate.

LEVÉE, the state ceremonial of the sovereign receiving visits from those subjects whose position entitles them to that honor. By the usage of the court of Great Britain, a levee differs from a drawing-room in this respect, that gentlemen only are present (excepting the chief ladies of the court), while at a drawing-room both ladies and gentlemen appear. The name is owing to such receptions being originally held in the monarch's bedchamber at the hour of rising (Fr. *lever*).

LEVÉE, the French name for an embankment (q.v.)

LEVEL AND LEVELING. Level is a term applied to surfaces that are parallel to that of still water, or perpendicular to the direction of the plumb-line; it is also applied to the instrument employed in determining the amount of variation from perfect levelness. The instrument is a cylindrical glass tube very slightly convex on one side, and so nearly filled with water, or, what is better, with alcohol, that only a small bubble of air remains inside. The level is then mounted on a three or four legged stand, with its convex side upwards, and by means of a pivot and elevating screws, is made capable of assuming any required position. If the level be properly constructed, the bubble should lie *exactly* in the middle of the tube when the instrument is properly adjusted, and, at the same time, the line of sight of the telescope attached to the level should be accurately parallel to the surface of still water. In ordinary levels, this first condition is seldom seen, and, instead, two notches are made on the glass to mark the position of the two extremities of the bubble when the instrument is level. The tube and bubble should be of considerable length to insure accuracy. The leveler requires two assistants, each furnished with a pole from 10 to 14 ft. high, and graduated to feet and inches, or feet and tenths of feet. If he wishes to measure the height of A above B, he may do this by beginning either at A or B. Let the latter be the case, then one assistant is placed at B, holding his pole upright; the other is sent forward to C (which must be below the level of the top of the pole at B); the surveyor, who places himself between them, reads off the height Bb, which he puts down in the back-sight column of his book, and then turns the level to C, reading off Co, which is entered in the front-sight column. The surveyor and his assistant at B then take up new positions, the latter at D; the back-sight Ce and the front-sight Dm are read off, and the process is repeated till one of the assistants reaches A. The excess of the sum of the back-sights over that of the front-sights gives the height of A above B. A little consideration will show that this method can only hold true when practiced on a small scale, and consequently in extensive surveys, the level (as found by the above described method) requires to be reduced by an allowance for the earth's curvature.

LEVEL AND LEVELING (ante). Custom has established the measurement of absolute levels from the average surface of the ocean—the mean between high and low water—as the zero level; when reckoned from any other zero level, they are relative levels. Leveling, or finding the difference between the levels of two or more points, is

designated by the term hypsometry in geodesy. There are three principal and independent methods of leveling. The first depends upon the fact that the surfaces of fluids at rest are perpendicular to the direction of the force of gravity; upon this is based the common level. In the second method, trigonometrical leveling, we must know, first, the zenith distance, or the angle between the zenith of the station and the object whose height we wish to find (making a correction for the effect of refraction), and, second, the horizontal distance from the station to the object, determined usually by triangulation. In accurate work a careful adjustment of the theodolite, the instrument used in this method, is necessary. Local attraction sometimes causes a deflection of the plumb-line, thus affecting measurements of zenith distance. Atmospheric refraction is a more important element of uncertainty, for which reason the horizontal distance should not exceed 12 or 15 miles. The coefficient of refraction is irregular, and varies with the temperature and pressure of the atmosphere; it is most steady and nearest its minimum between 10 A.M. and 2 P.M. From the above data, the difference in level is easily calculated. The weight of the atmosphere bearing upon a unit of surface diminishes in a geometrical progression as the heights increase in an arithmetical progression; therefore, by the third method, heights are determined with the barometer. Physicists have constructed numerous formulæ embodying the law of Mariotte, and introducing corrections for temperature, expansion of the air, and the effect of latitude and height upon the action of gravity. It is believed that considerable accuracy can be attained by this method, particularly if the annual means of temperature and pressure for the stations whose difference in level it is desired to find are substituted in the formula. Aneroid barometers have been graduated to indicate heights up to 12,000 or 16,000 ft.; they give only approximate results. If a delicate apparatus for determining the boiling-point of water be used, the corresponding heights taken from a table will give the reading of the barometer at that point, so that the instrument itself can be dispensed with. This depends upon the fact that the boiling-point of water decreases as the pressure of the atmosphere becomes less.

LEVELERS, a party which arose in the army of the long parliament, when it overawed that body, and sent the king to Hampton Court in 1647. They determined to level all ranks and establish an equality of titles and estates throughout the kingdom. Several of the officers belonging to this party were cashiered in 1649, and on the departure of Cromwell for Ireland, at the close of that year, they raised mutinies in various quarters, and were put down by Fairfax with bloodshed. John Lilburn, one of the chiefs of the faction—of whom it was said that, if none but he were left alive in the world, John would quarrel with Lilburn—published in 1649 his *Manifestations from J. Lilburn and others, styled Levelers*. They were not only treated as traitors by the king, but persecuted by Cromwell as dangerous to the state. One of their own works, *The Leveler, or the Principles and Maxims concerning Government and Religion of those commonly called Levelers*, shows that in politics their fundamental principles included: 1. The impartial authority of the law; 2. The legislative power of parliament; 3. Absolute equality before the law; 4. The arming of the people for securing the enforcement of the laws, and the protection of their liberties. In religion they claimed: 1. Absolute liberty of conscience; 2. Freedom for every one to act according to his knowledge, even if this knowledge should be false; 3. Religion to be considered in two aspects—one as the correct understanding of revelation, which is a private affair, the other as its effects manifested in actions, which are subject to the authorities; 4. They condemned all strife on matters of faith and forms of worship. This sect disappeared at the time of the restoration.

LE' VEN, LOCH, a beautiful sheet of water, of an oval form, in the e. of Kinross-shire, Scotland, measuring between 10 and 11 m. in circuit, and dotted here and there with small islands, the chief of which are St. Serf's inch, at the e. end, 80 acres in extent, with the remains of a religious house of great antiquity (see CULDEES), and another of 5 acres opposite the town of Kinross, on which stand the ruins of loch Leven castle. The loch is supplied by several small streams, and empties itself by the Leven into the firth of Forth. It has long been celebrated for the quantity and quality of its trout, which are of excellent flavor, and average about a pound in weight, although some are found of 4, 6, and even 10 lbs. Pike and perch also occur; a pike was caught in 1846 weighing 29 lbs. The rich color of the loch Leven trout is due to the abundance of a certain kind of crustacea upon which they feed. Loch Leven castle is connected with several events in Scottish history, the most noted being the imprisonment of queen Mary in June, 1567. Here she was forced to sign her abdication of the throne; and, after one unsuccessful attempt, succeeded, by the aid of George Douglas, the governor's brother, and of Willie Douglas, "a foundling," supposed to be a relative of the family, in effecting her escape (May 2, 1568).

LEVEN, LOCH, an arm of the sea, or rather of loch Linnhe (q.v.), on the w. coast of Scotland, between Argyle and Inverness, is about 11 m. in length, by, on an average, less than 1 m. in breadth, and is remarkable for the wildness and grandeur of its scenery. The current produced in this loch by the ebb and flow of the tide runs at the rate of at least 4 m. an hour.

LEVER, the most simple and common, but, at the same time, most important of the seven mechanical powers, consists of an inflexible rod—straight or bent, as the case may be—supported at some point of its length on a prop which is called the *fulcrum*, and having the *weight* to be moved and the *power* to move it applied at other two points. In the accompanying illustration (fig. 1, a), AB is the lever, F the fulcrum, A and B the points of application of P and W, the power (or pressure) and weight respectively.

If the arms AF and BF be equal, the power P and the weight W must also be equal to produce equilibrium; if the arm of the power, AF, be longer than the arm of the weight, BF, then, to produce equilibrium, the power P must be less than the weight W, and *vice versâ*; if AF be double the length of BF, then B, to produce equilibrium, must be half of W; and, generally, as is shown in the elementary treatises on mechanics, the *power and weight are in the inverse ratio of their distances from the fulcrum*. This is equally true for straight or bent levers; but (fig. 1, b) the distance of the power and weight from the fulcrum is not, in all cases, the actual length of the arms, but the lengths of perpendiculars from the fulcrum upon the directions of the power and weight. This principle holds good, whatever be the relative positions of the power, weight, and fulcrum; and as there can be three different arrangements of these, we thus obtain what are called “the three kinds of levers.” The first kind (fig. 2) is where the fulcrum is placed between the power and the weight; the balance (q.v.), spade (when used for raising earth), see-saw, etc., are examples of this; and scissors and pincers are examples of double-levers of the same kind. Levers of the second kind (fig. 3) are those in which the weight is between the power and the fulcrum; examples of this are the crowbar, when used for pushing weights forward, the oar—the water being the fulcrum, and the row-lock the point of application of the weight—and the wheelbarrow; and of double-

Fig. 1. b.

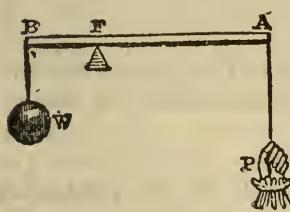

Fig. 2

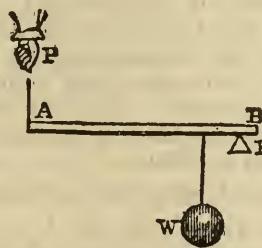

Fig. 3.

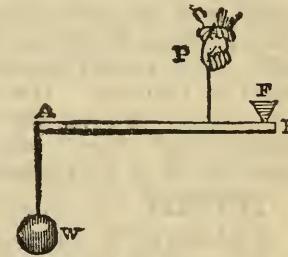

Fig. 4.

levers of this kind we have nut-crackers as an example. In levers of *the third kind* (fig. 4), the power is between the weight and the fulcrum. Fishing-rods, whips, umbrellas, and most instruments used with the hand alone, are levers of the third kind, and shears, tongs, etc., are examples of double-levers of this class. It is evident that, to produce equilibrium in levers of the first kind, the power may, according to the ratio of the lengths of the arm, be either greater or less than the weight; in the second kind, it must always be less; and in the third kind, always greater. This is expressed in technical phrase by saying that the first kind of lever gives a *mechanical advantage* or *disadvantage* (see MECHANICAL POWERS), the second always gives a mechanical advantage, and the third always a mechanical disadvantage. Levers of the second kind, having the same mechanical advantage, are, when worked by man, twice as powerful as those of the first kind, because in the one case he uses his muscular force as the power, in the other case only his weight. Levers of the third kind are used when velocity, or a large extent of motion, is required at the expense of power, and we consequently find this form much used in the structure of the limbs of animals. The structure of the human arm (fig. 5) is a very good example of this; the fulcrum is the socket (C) of the elbow-joint, the power is the strong muscle (the *biceps*) which passes down the front of the *humerus*, and is attached at A to the *radius* (see ARM); the weight is the weight of the forearm, together with anything held in the hand, the two being supposed to be combined into one weight acting at B. By this arrangement, a large extent of motion is gained, by a slight contraction or extension of the muscle.

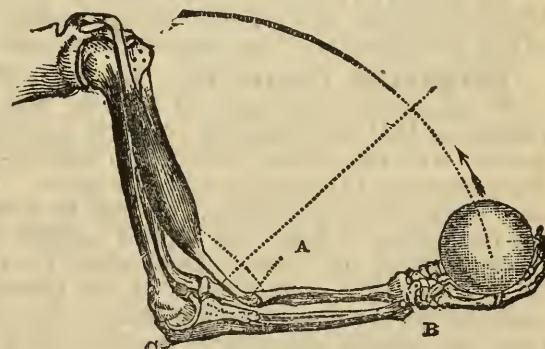

Fig. 5.

When a large mechanical advantage is required, this may be obtained, without an inordinate lengthening of the lever, by means of a combination of them (as in fig. 6).

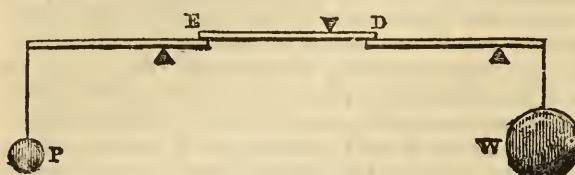

Fig. 6.

or) 54 in.; and, as the extent of sweep of the power cannot be largely increased without inconvenience, the advantages of this machine are confined within narrow limits.

LÉVÈQUE, JEAN CHARLES, b. Bordeaux, France, 1818. He made careful study of the Greek and Alexandrian philosophers, and resided at Athens 1847-48. In 1856 he was appointed professor in philosophy at the college de France; in 1865 a member and in 1873 a vice-president of the academy of moral and political sciences. His writings are remarkable for erudition, and his work *La Science du Beau* received several prizes from French academies.

LEVER, CHARLES, Irish novelist, was b. in Dublin, Aug. 31, 1806. He was educated for the medical profession, studying first at Trinity college, and afterwards on the continent. After taking his degree at Göttingen, he was attached (as physician) to the legation at Brussels, and, on his resignation of that post, became editor of the *Dublin University Magazine*. He opened his brilliant literary career by *Harry Lorrequer*; after which he published a whole library of fiction, the larger proportion of which was issued in the serial form with illustrations. Among Lever's best novels may be specified *Charles O'Malley*; *Tom Burke*; *Roland Cushel*; *The Knight of Gwynne*; *The Dodd Family Abroad*; *Davenport Dunn*. When he undertook the editorship of the famous Irish magazine, Lever fixed his residence in the neighborhood of Dublin; but when, after a few years' trial, his work became distasteful, he removed to Florence. He was appointed vice-consul at Spezzia in 1858, and was transferred in 1867 to Trieste, where he died in 1872. The earlier novels of Lever are remarkable for a certain boisterous mirth and whirl of incident. His ladies and gentlemen seem under the influence of champagne, his peasants and servant-men of "potheen." Latterly, the current of his genius became broader and clearer, and several of his later works have a higher interest. A life of Lever by N. J. Fitzpatrick appeared in 1879.

LEVERETT, the young of the hare during the first year of its age.

LEVERETT, FREDERICK PERCIVAL, 1803-36; b. at Portsmouth, N. H.; graduated at Harvard in 1821, and was subsequently principal of the Boston Latin school. He was the author of a Latin lexicon and various Latin classics. Died in Boston.

LEVERETT, Sir JOHN, Bart., 1616-79; b. in England, and came to America with his father in 1633. He was an intimate friend of Cromwell and an officer in his army. In Massachusetts he was speaker of the general court, 1665-71; maj gen., 1663-73; and deputy governor, 1671-73. He was knighted and made a baronet by Charles II. in 1676.

LEVERETT, JOHN, 1662-1724; b. Boston; grandson of sir John; graduated at Harvard in 1680, and president of the college 1707-24. He was a lawyer and judge, and at one time speaker of the general court, and highly esteemed for his learning.

LEVERRIER, URBAIN JEAN JOSEPH, a French astronomer of great celebrity, was b. at St. Lô, in the department of Manche, Mar. 11, 1811. He was admitted into the polytechnic in 1831, and was subsequently employed for some time as an engineer in connection with the tobacco board. In 1836 he published *Mémoires sur les Combinations du Phosphore avec l'Hydrogène et avec l'Oxygène*. His *Tables de Mercure*, and several memoirs on "the secular inequalities," opened to him the door of the academy in 1846; and at the instigation of Arago he applied himself to the examination of the disturbances in the motions of the planets, from which the existence of an undiscovered planet could be inferred; and, as the result of his laborious calculations, directed the attention of astronomers to the point in the heavens where, a few days afterwards, the planet Neptune was actually discovered, the same thing being also, by a remarkable coincidence, done about the same time, and independently, by the English astronomer Adams (q.v.). For this Leverrier was rewarded with the grand cross of the legion of honor, a professorship of astronomy in the faculty of sciences at Paris, and various minor honors. When the revolution of 1848 broke out, Leverrier sought distinction as a democratic politician; the department of La Manche chose him in May, 1849, to be a member of the legislative assembly, where he at once became counter-revolutionary; and in 1852 Louis Napoleon made him a senator. In 1854 Leverrier was appointed to the directorship of the observatory of Paris, an office which, save during an interval of three years (1870-73), he held till his death, Sept. 23, 1877.

LE VERT, OCTAVIA WALTON, 1810-77; b. near Augusta, Ga. Her grandfather, George Walton, was a signer of the declaration of independence, and her father, who

Here the levers have their arms in the ratio of 3 to 1, and a little consideration will make it plain that a power (P) of 1 lb. will balance a weight of 27 lbs.; but in this instance the particular defect of the lever as a mechanical power shows itself prominently; for if the weight has to be lifted 2 in., the power requires to be depressed (2×27

bore the same name, was territorial secretary, and for a time acting governor of the territory of Florida. His daughter was with him at Pensacola, where she received her education, and where as a young lady she was a great favorite in society. She was invited to select a name for the capital of Florida, and chose the Indian name Tallahassee. Her father, at the close of his official term, removed to Mobile, where in 1836 she was married to Dr. H. S. Le Vert. Before this, however, she passed one or two winters in Washington, where she enjoyed the friendship of Webster, Clay, Calhoun, and other eminent men of that time, and won distinction by the accuracy of her reports of certain debates in congress. After 1853 she spent two years in Europe, and was received into the best society in England and on the continent. She subsequently gave an account of her observations in 2 vols. entitled *Souvenirs of Travel*. She did much to promote the objects of the Mount Vernon association, and for the comfort of the confederate soldiers during the war of the rebellion. It is understood that she left in manuscript *Souvenirs of Distinguished People* and *Souvenirs of the War*, but they have not been published. Died in New York.

LEVI, the third son of Jacob and Leah (Gen. xxix. 34). He is conspicuous through the part he took with his brother Simeon in the slaughter of the inhabitants of Shechem, together with Hamor and Shechem, their princes, while in a defenseless state, in order to avenge the wrong inflicted by the latter on Dinah (Gen. xxxiv.). Jacob, even on his death-bed, could not forgive this their bloody "anger and self-will," and pronounced this curse on them both, that they should be scattered among Israel (Gen. xlvi. 7). How this was fulfilled in the case of Levi, whose descendants, singled out for the service of the sanctuary and the general instruction of the people, had to reside in cities set aside for them throughout the length and the breadth of the land, will be more fully shown under **LEVITES**. In Egypt the house of Levi had divided itself into three families, those of Gershon, Kohath, and Merari.

LEVI, LEONE, PH.D., b. Ancona, Italy, of Jewish parentage. In 1844 he removed to Liverpool, where he was naturalized as a British citizen. He was one of the founders of the Liverpool chamber of commerce in 1849, and in 1852 was appointed professor of commercial law in university college, London. In 1859 he became a barrister, and in 1861 received the doctorate from Tübingen. He has published many valuable papers upon statistical and commercial affairs, and is author of *Commercial Law* (4 vols.), *On Taxation*, and *International and Commercial Law*.

LEVIATHAN, a scriptural term for a great "sea-monster," but more especially a crocodile (q.v.). In the Prophets and Psalms it is occasionally used as a symbol of Egypt and Pharaoh. Many wondrous allegorical tales are connected with this word in the Talmud and Midrash.

LEVICO, a t. of the Tyrol, Austrian empire, 9 m. s.e. by e from Trent (*Trent*), in the upper part of the valley of the Brenta, and near the small lake of Levico, where that river rises. Mulberry trees are cultivated, and the care of the silk-worm and spinning of silk employ many of the people. Pop. '69, 6,250.

LEVIGATION, a process of the laboratory for converting different substances to a smooth, uniform powder by grinding them between two flat surfaces. The same process essentially is used in grinding paints, printing-inks, and drugs.

LEVIRATE MARRIAGE (Lat. *levir*, a husband's brother) is the marriage of a man to the widow of his deceased brother. This was an ancient usage of the Hebrews when an Israelite died without male issue, and his widow could compel his next older brother to marry her. This law was afterwards enacted in the Mosaic code, though definite limits were prescribed for it, and some of the irksome and odious features which it had in ancient times were removed. This law was not peculiar to the Hebrews, but prevailed among the Moabites, Persians, and inhabitants of India, and still exists in Arabia, Abyssinia, and other nations.

LEVIS, a co. in central Quebec, Canada, having the St. Lawrence river for its n. and n.w. boundary, and on the n.e. the straits that separate it from the isle of Orleans; about 256 sq.m.; pop. '71, 24,831. It is drained by the Chaudiere and Etehemin rivers, intersecting it centrally. It contains the town of Levis, in the n., opposite the city of Quebec, and communicating with it by a ferry, being a port of entry, and the landing-place for passengers by European steamers. It is intersected by the Grand Trunk railway and the Levis and Kennebec railway. Its surface is varied by the picturesque islands which interrupt its river courses, and their precipitous and densely wooded banks. It contains several towns of considerable commercial activity, where capital is employed in saw and grist mills, axe factories, tanneries, and an extensive lumber trade. Seat of justice, Levis.

LEVIS, or **POINT LÉVI**, a t. in central Quebec, Canada, opposite the city of Quebec, on the river St. Lawrence, 172 m. n.e. of Montreal, on the s. shore of the river; pop. 6,691. It contains the wharves where passengers from the ocean steamships are landed, and is protected by substantial fortifications. It is connected by a ferry with the city of Quebec, a mile distant, and is about 4 m. from the isle of Orleans, a large island dividing the river St. Lawrence at that point. It is engaged in a brisk trade,

has several saw-mills and factories, a good hotel, a convent, a board of trade, and 2 telegraph offices.

LEVITA, ELIJAH (*Halevi, Ben Asher; Ashkenasi* = the German, *Habachur* = the master, *Hamedakdak* = the grammarian), a Jewish grammarian and exegete, who, though much overrated, still holds a high rank among Hebrew scholars, was b. at Neustadt, on the Aisch, near Nuremberg, in 1470. One of the then frequent expulsions of the Jews forced him to seek refuge in Italy, where he held a high position as teacher of Hebrew, first in Venice, next in Padua, finally in Rome (1514). Cardinal Egidio here became his patron and pupil, but even he could not prevent Levita's again being expelled this city, together with his Jewish brethren, in 1527. He then returned to Venice, where he lived for the most part until his death, 1549. His principal exegetical and biblical works are a *Commentary on Job in Verse*, a *German Translation of the Psalms*, an *Edition of the Psalms with Kimchi's Commentary*, an *Edition of the Targum to Proverbs*, and of *Kimchi's Commentary to Amos*. His grammatical works are chiefly *Masoreth Hammesoreth* (Tradition of Traditions), a treatise on the vowel-points, etc., in the Old Testament; *Tub Tuam* (Good Judgment), a treatise on accents; *Sefer Habachur* or *Dikdukk* (Grammar), besides many minor treatises. In the field of lexicography he has contributed *Meturgeman* (= Dragoman), an attempt at a Talmudical and Targumical dictionary; *Tishbi*, a complement to Hebrew dictionaries; *Shemot Debarim* (The Names of Things), a Hebrew-German dictionary; *Nimukim*, glosses to David Kimchi's *Book of Hebrew Roots*, etc. Most of Levita's works have been repeatedly edited and partly translated by Buxtorf, Münster, Fagius, and others, who owed most of their Hebrew knowledge to Levita exclusively—a fact not generally recognized.

LEVITES, the descendants of Levi (q.v.), who were singled out for the service of the sanctuary. The term is more particularly employed in contradistinction to priests (q.v.), in designating all those members of the tribe who were not of the family of Aaron. It was their office—for which no further ordination was required in the case of the individual—to erect, to remove, and to carry the tabernacle and its utensils during the sojourn of the Israelites in the wilderness. When the sanctuary had found a fixed abode, they acted as its servants and guardians, and had to assist the priests in their holy functions in the sanctuary and in their medical capacity among the people. The vocal and instrumental music in the temple was likewise under their care, as were also the general instruction of the people, certain judicial and administrative functions, the keeping of the genealogical lists, and the propagation of the Book of the Law among the community. In order to enable them better to fulfill these functions, no special part of the land was allotted to them, but they were scattered—in accordance with Jacob's last words (Gen. xlxi. 7)—in Israel; 48 Levitical cities, among which there were also certain "cities of refuge," being set aside for them on both sides of the Jordan; without, however, preventing their settling wherever else they pleased. Their revenues consisted of the annual tithe (q.v.), and of a share in the second tithe, due every third year, and in the sacrificial repasts. The length of their service varied at different times. No special dress was prescribed for them until the time of Agrippa.

While in the desert not more than 8,580 serviceable men strong, they had, under David, reached the number of 38,000 men fit for the service, 24,000 of whom this king selected, and divided them into four classes—sacerdotal assistants, doorkeepers, singers and musicians, and judges and officers. A very small number only returned from the exile, and all the Mosaic ordinances with respect to their cities, tithes, share in sacrificial repasts, etc., were virtually abrogated during the second temple. Nothing but the service in the temple, in which they were assisted by certain menials called *Nethinim*, was left to them. It may be presumed that they earned their livelihood partly like the rest of the community, partly as teachers, scribes, and the like. Their traveling-garb consisted, according to the Talmud (*Jebam.*, 122 a), of a staff, a pouch, and a Book of the Law. Foreign rulers also granted them exemption from taxes. This is the only tribe which is supposed to have kept up its pure lineage to this day, and certain, albeit small, signs of distinction are still bestowed upon its members, more especially in the case of the presumed descendants of Aaron (the *Kohanim*). But the purity of lineage is more than questionable in many instances.—Levites is also the name given to certain sacerdotal assistants in the Romish church.

LEVITICUS (Heb. *Vajikra*) is the name of the third book of the Pentateuch, containing chiefly the laws and ordinances relating to the Levites and priests. Little or no progress is made in it with respect to the history of the people, and the few events recorded are closely connected with the special aim and purport of the book. The erection of the sanctuary having been described at the end of Exodus, the nature of the worship—revealed by God within this tabernacle—is set forth in Leviticus, which forms its continuation. The order followed is not strictly systematical, but a certain plan is apparent, in its outlines at least.

The age and authorship of Leviticus will be considered, together with that of the other "Mosaic" records, under PENTATEUCH. We shall confine ourselves to mentioning, in this place, that the whole of the supposed "original" or Elohistic document (see GENESIS) is by modern critics held to be embodied, in its primitive shape, as nearly as possible at least, in the "Leviticus" as we have it now. Among the few additions and

alterations ascribed to the Jchovist are reckoned chapters x. 16–20, xx. 20–25, xxv. 18–22, and the greater part of chap. xxvi. (3–35), the second verse of which (end of *Parashah xxxii.*) is held to have concluded the Sinaiitic legislation in the original document.

LEVITICUS (*ante*), the name taken from the Septuagint of the third book of Moses, and signifying “belonging to Levi,” well represents its contents, which are precepts and ordinances for the government of the priests, Levites, and people in their special relations to God. The Hebrew title, which is simply the first word of the book, “And he called,” also points it out as a collection of divine commands. These commandments, as recorded in this book, have reference to sin as committed by men; to the sacrifices which the people should bring as an atonement; and to the priests who should offer them in the people’s name. The first great fact to be perceived, in order to a right understanding of the book, is that it exhibits divinely appointed emblems of divine realities. All that it records, the tabernacle, the priest, the altar, the sacrifice, the incense, are emblems employed by him who gave signs to his servants, the prophets, and in his own teachings used similitudes. This being kept in mind, the book may be regarded as presenting three principal topics: I. THE PRIESTS.—They were at once the representatives of the people in their relations to God, and of God in his relations to them. Every man in the nation was vitally interested in the duties and burdens of the office, and might justly have been required to bear his portion of them; and in regard also to its honors, all the people were a kingdom of priests. At the beginning of their history the first-born sons of all the families, in all the tribes, were to be consecrated to the Lord as representatives of the whole. Afterwards, as an equivalent for them, the tribe of Levi was set apart to the service. Of these the sons of Aaron were to be priests, and Aaron was to be the high-priest. The whole tribe was considered as performing one service, the magnitude and importance of which were represented both by the great number consecrated and employed and by the dignity of the high-priest. All the service performed by them all was crowned with his work, and the splendor vested in him irradiated them all. The high-priest was anointed with holy oil, compounded of the most precious materials and devoted strictly to that use alone. By this, poured on him and running down to the skirts of his garments, he was consecrated to the Lord. He was clothed sometimes in splendid robes composed of blue, purple, scarlet, fine linen, and gold, elaborately wrought together, with a breast-plate of precious stones, and a miter on which blazed the inscription, formed of dazzling gems, “Holiness to the Lord.” This represented the majesty of God. At other times he was required to minister in plain linen garments, which were emblematic of the humility appropriate for men in their approaches to God. Bodily perfection and personal purification were required in the priesthood as emblems of the holiness necessary for all men in approaching to God. The priestly office was, according to divine command, to be transmitted from father to son, and the oldest son of the high-priest was to be his successor. By this arrangement, while the individual priest could not continue by reason of death, the office was made perpetual. II. THE SACRIFICES.—1. Sacrifices for the priests themselves were to be offered before they could officiate for the people. These were required specially at their consecration, and generally before they made atonement for the people. Thus their own sinfulness was acknowledged and atoned for separately, in order that, although compassed with infirmities, they might be accounted worthy to stand emblematically between God and the people. 2. No sacrifice could be accepted unless accompanied with the shedding of blood. That represented *the life*, and therefore the blood of animals was consecrated as an emblem of atonement for sin, and was to be applied to all things connected with the offering of worship. 3. The animals offered were to be taken from those most valued, and must be without imperfection or blemish. And to their life many other choice things were to be added—such as fine flour, pure oil, and frankincense—in order to increase the costliness and therefore the emblematic significance of the offering. 4. The sacrifices were to be numerous and perpetual. Every man was required to present offerings for himself whenever he sinned against God, or trespassed against his fellow-men; and for sins of ignorance, as well as for willful transgressions. After the settlement in Canaan, wherever a man lived, he was required to present his offering at the tabernacle or temple. These personal sacrifices were burdensome, and would frequently recur. Besides these, a general daily morning and evening sacrifice was ordained; and on the Sabbath days this was doubled. On feast days, additional offerings were prescribed. One day in every year was consecrated with special solemnity as a day of atonement, in which all the people were required to abstain from servile labor, and to afflict their souls, under penalty of being cut off from the congregation. On that day the high-priest alone of all the priests and people, and he on that day only in all the year, was to enter the most holy place, taking with him blood, which he must sprinkle seven times before the mercy-seat. On that day the sin-offering consisted of two animals, one of which was sacrificed on the altar, while on the head of the other the high-priest laid both his hands, and confessed over it all the iniquities of the people and all their transgressions, putting them on its head, and sending it away into the wilderness. These solemn rites may be regarded as the closing sacrifice of the year, binding all together as one great offering, crowning them and imparting to them the highest measure of emblematic significance. All these were appointed to

be repeated year by year, through all generations, until the ordained end. III. THE SINS OF THE PEOPLE.—1. Their punishment. There were flagrant crimes for which no sacrifice would avail. He who committed them was to be cut off from his people. There were also sins against the sacrifice itself for which, in the nature of the case, no atonement could be made. National judgments were threatened against the general violation of the law by the people at large. For first offenses, disease, famine, and war, in lighter measures, were denounced. If notwithstanding these visitations, the people persisted in their offenses, sevenfold judgments would be sent. God would break the pride of power and make the heavens as iron and the land as brass. If then they refused to obey, wild beasts would be sent to destroy their children and cattle. If they were not reformed by these inflictions, the horrors of siege and of pestilence would be superadded. If still they were not subdued, their sanctuaries would be desolated, their cities laid waste, their land destroyed, and they themselves scattered among the nations. By these threatened judgments the evil nature of sin was powerfully pressed on their consciences and thoughts. 2. It was also emblematically set forth in the daily actions and circumstances of their lives. Of these, two may be specified: (1.) The distinction made between clean and unclean meat. All animals were divided into these two classes; the former of which only might be eaten, while the latter were to be an abomination in the sight of the people. While there may have been several reasons for this regulation, one object of it was to hold up the moral distinction between good and evil, holiness and sin, by reminding the people continually that in partaking of food they might do right or do wrong; and if in this constantly recurring act, so in all other actions of their lives. (2.) The disease of leprosy was an emblem of the awful nature and consequences of sin. As the disease was seated in the body, so sin is in the soul; as the disease might be transmitted by hereditary descent, so the sinfulness of mankind is continued from age to age; as leprosy was often manifested at first only by a single spot which spread over the body, so sinfulness of heart, often betraying itself at first only by slight outward transgressions, may increase in power until the whole character is defiled. Leprosy sometimes entered into a garment or a house; then the garment must be burned, and the house destroyed. So, by the sinfulness of men, a land being defiled, may be doomed to destruction, as Sodom and Gomorrah were destroyed. Yet as to Israel, their land was not to be forever desolate, nor were they to be utterly and finally cast off.

LEV'ULOSE, a variety of glucose, differing from ordinary glucose or dextrose by the property of turning the plane of polarization of light to the left (whence its name) instead of to the right, as in dextrose. A mixture of these two sugars constitutes *fruit sugar* or, as sometimes called, *invert sugar*, which also possesses left-hand rotation, because of the excess of left-handed power of the levulose constituent. Cane sugar may be inverted or transformed into a mixture of dextrose and levulose by warming it with dilute acids, or by the addition of yeast or diastase. To separate the levulose the fruit sugar is mixed with slaked lime and water. A solid compound of levulose and calcium is formed, the dextrose remaining in solution, allowing the precipitate to be removed, which, when suspended in water, may be decomposed by carbolic acid gas, by which means pure levulose is separated, carbonate of lime being formed as an insoluble precipitate. The solution containing the levulose may be concentrated by evaporation. Levulose is formed also by the action of dilute acids on inulin. It is a colorless, uncrystallizable syrup, having the sweetness of cane sugar, and exhibiting most of the reactions of dextrose, but is more soluble in alcohol. Its rotatory power at ordinary temperatures is much greater than that of dextrose, but diminishes as the temperature rises, while the rotatory power of dextrose is the same at all temperatures. See GLUCOSE.

LEVY (Fr. *levée*) is the compulsory raising of a body of troops from any specified class in the community for purposes of general defense or offense. When a country is in danger of instant invasion, a *levée en masse* is sometimes made—i.e., every man capable of bearing arms is required to contribute in person towards the common defense. On less urgent occasions, the levy may be restricted to a class, as to men between 18 and 40 years of age. At other times, a levy of so many thousand men of a certain age is decreed, and the districts concerned draw them by lot from among their eligible male population. In armies sustained by volunteering, the levy, which is a remnant of barbarous times, is unnecessary; but the system was frequently resorted to in France before the enactment of the conscription laws: 1862 has shown great levies in the United States of America; and in any country where great danger is apparent, and volunteers are not sufficiently numerous, recourse must at all times be had to a levy of the people.

LEVY, in law, the seizure of real or personal property by a sheriff in order to satisfy an execution against it. Real estate may be levied upon by setting forth by metes and bounds the portion seized; personal property must be brought into the actual possession or under the power of the sheriff.

LÉVY, a co. in w. Florida, on the gulf of Mexico, bounded n.w. by the Suwanee river; about 1000 sq.m.; pop. '80, 5,767—5,631 of American birth, 2,035 colored. Its southern portion is drained by the Withlacoochee river, forming its southern boundary and emptying into the gulf of Mexico. Its surface is generally level, consisting of exten-

sive swamps and large tracts of tillable lands covered with pine and cedar forests, and bearing the name of the *Gulf Hammock*. The portion under cultivation has a sandy soil, and among its staple products are oats, corn, tobacco, cotton, wool, sweet potatoes, and sugar-cane. In 1870 it had 5 manufacturing establishments, employing 45 hands, with a capital of \$12,000 and an annual product of \$58,000. It has grist-mills, and mills for the manufacture of pine lumber, cedar pencils, and cotton-gins. It is traversed by the Florida railroad, having a terminus at Cedar Keys, and its coast is indented by Wacasassee bay and Cedar Key bay. Seat of justice, Bronson.

LÉVY, ÉMILE, b. France, 1826; pupil of the *ecole de beaux arts* of Paris, in which he obtained the grand Roman prize in 1854. His painting of "Noah cursing Canaan," exhibited at the Paris exposition in 1855, was purchased by the government. Levy's most notable works since are "Répas de Martyrs," "Ruth et Naémi," "la Rentré des foins," "Vercingétorix se rendant au César," "la Messe au Champs," "Venus ceignant sa ceinture," "Diane la Mort d'Orphée," "l'Arc-en-ciel," "l'Hésitation," "le Christ au tombeau." In 1867 M. Levy received the medal of the exposition and the cross of the legion d'honneur.

LEWES, the county t. of Sussex, market-t., and parliamentary borough of England, most picturesquely situated on the navigable river Ouse, 50 m. s. from London, and 7 from Newhaven, which is its port. Pop. '71, 10,753. Lewes is the seat of the assizes. It returns one member to parliament, and is the seat of election for East Sussex. Fairs are held here on Whitsunday and May 6 for horses; on July 20, for wool; and on Sept. 21 and 28, for Southdown sheep, of which from 40,000 to 50,000 are often collected. The chief trade is in grain, sheep, and cattle. There are three iron foundries; and ship-building, brewing, tanning, rope-making, and lime-burning employ many of the inhabitants. Races are held here annually in July or Aug., near Mount Harry, on the Downs, where the celebrated battle of Lewes was fought, between Henry III. and the insurgent barons of the kingdom, on May 14, 1264. The castle, the principal tower of which now forms the museum of the Sussex archaeological society, was long the seat of William de Warrenne, whose remains and those of his wife, Gundrada, daughter of the conqueror, were discovered here. Lewes is of very remote origin, and was the site of a Roman station or camp. Three papers are here published, and the town is governed by two high-constables.

LEWES, GEORGE HENRY, a versatile and influential English author, was b. at Griff, Warwickshire, April 18, 1817, educated at various schools, studied medicine for some time, and finally resolved to devote himself to authorship. In his twenty-first year, he proceeded to Germany, where he remained for two years, studying the life, language, and literature of that country. On his return to England, he took up his residence in London, and has ever since been one of the most industrious as well as successful of *littérateurs*. An intellect clear and sharp, if not remarkably strong; a wit lively and piquant, if not very rich; sympathies warm, if not wide; and a style as firm as it is graceful, have made Lewes one of the best of critics and biographers. He has contributed to most of the quarterlies and magazines of the day; edited (with admirable talent) the *Leader* newspaper from 1849 to 1854; composed novels, comedies, and tragedies; and, of late years, has turned his active mind to the study of physiology and cognate branches of science, in which he has won as high a reputation as in the lighter departments of literature. His principal works are his *Biographical History of Philosophy* (1845, a new edition of which, much enlarged, was afterwards published); *The Spanish Drama, Lope de Vega and Calderon* (1846); *Comte's Philosophy of the Sciences* (forming one of the volumes in Bohn's *Scientific Library*, 1853), a work which is not a mere translation of the French savant, but in several parts a complete remodeling, by which the style does not suffer; *Life and Works of Goethe*, etc. (1855); *Seaside Studies at Ilfracombe* (1858); *Physiology of Common Life* (1860); *Problems of Life and Mind* (1873-74); *On Actors and the Art of Acting* (1875); and *The Physical Basis of Mind* (1877). In 1865 Lewes founded the *Fortnightly Review*, and for a time was its editor. He died Nov. 30, 1878.

LEWIN, THOMAS, b. at Ifield, Sussex, England; educated at Trinity college, Oxford; admitted to the bar in 1833, and in 1853 became conveyancing counsel to the court of chancery. He wrote a treatise on *The Law of Trusts*, but most of his works are of a religious character. Among them are *The Life and Epistles of St. Paul*; an *Essay on the Chronology of the New Testament*; *Jerusalem, a Sketch of the City and Temple from the Earliest Times to the Siege by Titus*; *Siege of Jerusalem by Titus*; and *Fasti Sacra, or a Key to the Chronology of the New Testament*. His work on *Cæsar's Invasion of Britain*, in which he questioned the correctness of the current belief as to the landing-place of that conqueror, involved him in a controversy with Dr. Airy, the astronomer royal, and led to new investigations. After the publication of his work on St. Paul, he devoted many years to a study of the apostle's missionary journeys, visiting in person nearly every place named in the accounts given in the New Testament of his journeyings. The results of these later researches are embodied in a second edition of his previous work, in two large volumes, profusely illustrated. His views as to the sacred localities of Jerusalem, especially in respect to the site of the temple, which differ from those of Robinson and others and have led to much controversy, have not been generally accepted.

LEWIS, or **SNAKE RIVER**, the great southern branch of Columbia river, United States of America, rises in the Rocky mountains, on the western borders of Nebraska territory, and after a circuitous course, the general direction is n.w. through Oregon territory, it joins the Columbia, near fort Walla-Walla, lat. $46^{\circ} 6' \text{ n.}$, long. $118^{\circ} 40' \text{ w.}$ Length, 900 miles.

LEWIS, a co. in n.e. Kentucky, having the Ohio river for its n. boundary, separating it from the state of Ohio, and the North fork of the Licking river for its s.w. boundary; drained by the branches of the Ohio, flowing from all portions of the county; about 430 sq.m.; pop. '80, 13,154—12,984 of American birth, 229 colored. It is largely covered with forests on a hilly surface with a limestone formation. Its soil is fertile along the water-courses, and is adapted to the raising of live stock, every variety of grain, fruit, dairy products, tobacco, wool, sweet potatoes, wine, and honey; other products are maple sugar, flax, and hops. Its capital is represented by tanneries, currying establishments, lumber, flour and saw mills, boat-yards, and manufactories of hubs and spokes. It had, in '70, 25 manufacturing establishments, employing 93 hands, with a capital of \$71,150, and an annual product of \$273,631. Seat of justice, Vanceburg.

LEWIS, a co. in n.e. Missouri, having the Mississippi river for its e. boundary, separating it from Illinois; 500 sq.m.; pop. '80, 15,925—15,080 of American birth, 1405 colored. It is drained by the Wyaconda river, flowing s.e., and the North and Middle branches of the Fabius river, flowing from n.w. to s.e. across the county, emptying into the Fabius and thence into the Mississippi. It is intersected by a branch of the Quincy, Missouri and Pacific railroad, from Quincy to Kirksville, in the s.w. section; and the St. Louis, Keokuk and Northwestern railroad, following the course of the Mississippi river. Its surface is well timbered and undulating. Its soil is a deep rich loam, fertile to a remarkable degree, and adapted to the raising of live stock, fruit, every variety of grain, tobacco, wool, sweet potatoes, and sorghum. Value of all live stock in '70, \$1,006,610. Cash value of farms in '70, \$5,239,259. It produced in '70, 1206 gall. of wine, and 16,707 lbs. of honey. Lumber of farms in '70, 1541. It had in '70, 165 manufacturing establishments, employing 497 hands, with a capital of \$196,570, and an annual product of \$677,943. Its leading industries are in the manufacture of lumber, carriages, cooperage, saddlery and harness, tin, copper, and sheet-iron ware, and snuff. It has flour and saw mills and tobacco factories. Coal is found and limestone in great abundance.

LEWIS, a co. in n. New York, intersected by the Black river and its branches, among them the Beaver river, rising in a small lake on its eastern border, the Moose, and the Oswegatchie; 1280 sq.m.; pop. '80, 31,356. Its surface is hilly, rising in some portions to the height of 1400 ft., and in the w., that being the most productive region, to an elevation of 1500 and 1700 feet. It is well wooded with groves of sugar-maple and hard-wood trees, particularly in the eastern portion. It has excellent pasturage, and its soil along the river bed, having a sub-stratum of limestone, is very fertile, and adapted to the raising of live stock, every variety of grain, tobacco, wool, maple sugar, flax, and hops. Value of live stock in '70, \$2,635,706. It produced in '70, 2,080,259 lbs. of butter and 7,331 lbs. of honey. It had in '70, 336 manufacturing establishments, employing 1487 hands, with a capital of \$3,110,325 and an annual product of \$3,573,600. Its leading industries are lumber, leather, cooperage, carriages, paper and wooden wares, woolen goods, pig iron, and tin, copper, and sheet-iron ware. Seat of justice, Lowville.

LEWIS, a co. in central Tennessee, having the Buffalo creek for its s. boundary, and the Duck river crossing its extreme n.e. corner; about 350 sq.m.; pop. '70, 1986—1985 of American birth, 188 colored. Its surface is diversified, sparsely settled, and is divided into hill, valley, and woodland, the latter predominating. Live stock is produced, peanuts, and every variety of grain. Seat of justice, Newburg.

LEWIS, a co. in s.w. Washington territory, drained by the Cowlitz river, flowing w. and s.w., having the Chehalis river for its n.e. boundary, running n.w. and emptying into the Pacific; and part of the Cascade range of mountains for its e. border; 1700 sq.m.; pop. '70, 888—779 of American birth. It is thinly populated, and its surface is extensively covered with timber. The soil of its valleys is very fertile, and adapted to the raising of live stock, wool, dairy products, and every variety of grain. Its rivers are navigable, and it is intersected by a branch of the Northern Pacific railroad, which crosses it centrally, running from Olympia in a northern county to Kalama in the county directly s. of it. Its water-power is utilized by flour and lumber mills. Seat of justice, Cliaquato.

LEWIS, a co. in n. West Virginia, intersected centrally by the West fork of the Monongahela river running northward; drained also by the Little Kanawha river; about 475 sq.m.; pop. '80, 13,270—12,806 of American birth, 326 colored. It presents an uneven surface, alternate hill and valley, tillable lands, and extensive forests. It contains beds of iron and bituminous coal easily mined. Its soil is adapted to the raising of live stock, fruit, buckwheat, oats, corn, rye, wheat, tobacco, wool, sweet potatoes, and dairy products; also maple sugar, sorghum, and flax. It has woolen factories, and

saw and planing mills. Cash value of farms in '70, \$2,417,175, numbering 1004. Seat of justice, Weston.

LEWIS, or **LEWISSON**, a device for securing heavy blocks of stone to the tackle for hoisting. It is supposed to be named from Louis XIV. of France, but there is evidence that it was used long before his time. In the stone is a quadrangular cavity, widened at the bottom on two opposite sides as in dovetailing. Into this cavity are thrust two wedge-shaped pieces of iron, heads downward, and then a third piece, perfectly straight, is inserted between them to hold them in place. The ends projecting above the stone present each an eye for a bolt, which passes through the whole and forms a handle for lifting the stone. After the stone is raised to its place, the bolt is first taken out; then the center-piece, which has held the wedge-shaped outer pieces firmly in place, is withdrawn, setting the latter free.

LEWIS, ANDREW, 1730-80; b. in Ulster co., Ireland; while an infant was brought by his father to Bellefonte, Augusta co., Va. In the old French war he was a volunteer in the Ohio campaign in 1754, a maj. in Braddock's expedition, and present at the great defeat on the Monongahela in 1755. He commanded the Sandy Creek expedition in 1756, and in 1758 was taken prisoner by the French and carried to Montreal. Ten years later he served as commissioner of Virginia in the treaty made with the Iroquois at fort Stanwix. In 1774 he was raised to the rank of brig. gen., and in the same year commanded the Virginia troops in the victory over the Shawnee confederacy at the mouth of the Kanawha river. He was a member for several years of the Virginia house of burgesses, and in 1776, at the request of Washington, was appointed by congress a brig. gen., and took part in the military operations against lord Dunmore. Ill health compelled him to resign his commission in 1777, and he died in Bedford co., Va. He was very highly esteemed by Washington, and his statue occupies one of the pedestals around the Washington monument at Richmond. He had four brothers, Samuel, Thomas, William, and Charles, scarcely less prominent than himself in the annals of Virginia.

LEWIS, CHARLES, b. Va. and killed at the battle of Point Pleasant, Oct. 10, 1774. Under his brother Andrew he served with distinction and became a col.

LEWIS, DIO, b. N. Y., 1823; studied at the Harvard medical school in Boston, and practiced for a time successively at Port Byron and Buffalo, N. Y. At the latter place he published a monthly periodical, in which he advanced the idea that diet and exercise should take the place of drugs in the treatment of disease. As a means of preserving health and removing disease he introduced the system of light gymnastics for the use of schools and private classes, and in 1863 founded in Boston a school for training teachers of this system. Afterwards he established at Lexington, Mass., a seminary for young ladies, in which he sought to carry out his ideas of diet, air, and exercise. The building used for this school was destroyed by fire in 1868, and Dr. Lewis thereupon engaged in medical practice in Boston. He established in that city the Turkish bath, which he regards as a powerful sanitary agent. His principal publications are: *The New Gymnastics; Weak Lungs and How to Make Them Strong; Talks about People's Stomachs; Our Girls*, and *Chats with Young Women*.

LEWIS, ELLIS, LL.D., 1793-1871; b. Penn.; learned the trade of a printer in his youth, and in 1822 was admitted to the bar. In 1824 he was deputy attorney-general of Pennsylvania, attorney-general in 1832, and subsequently a judge in several courts. In 1854 he was elected chief-justice of the supreme court, and re-elected in 1857. He was distinguished for his skill in medical jurisprudence, which won for him the degree of M.D. In 1858 he was appointed a commissioner to revise the criminal code of the state. He wrote *Abridgment of the Criminal Law of the United States*. Died in Philadelphia.

LEWIS, ESTELLE ANNA BLANCHE, b. near Baltimore, 1824; educated at Miss Willard's seminary in Troy, N. Y.; married in 1841 Sidney Lewis of Brooklyn, N. Y., who is now deceased. She has lived most of the time in Europe since the death of her husband. Among her publications are: *The Record of the Heart; The Child of the Sea; The Myths of the Minstrel*; and *Helenah* (a tragedy). A collection of her poems was published in this country in 1858, and in England in 1866. Since that time she has published *Sapho of Lesbos; The King's Stratagem* (both tragedies); and letters from Europe signed *Stella*.

LEWIS, FRANCIS, 1713-1803; b. Llandaff, Wales, and educated at Westminster. He came to America, settling in New York, where he was a merchant. In 1757 he was on the staff of gen. Mercer in the old French war, and being taken prisoner at Oswego was sent to France. England, in consideration of his services, gave him 5,000 acres of land. He was one of the signers of the declaration of independence, and, 1775-79, a member of congress. He and his wife were imprisoned by the enemy for a long time, and the greater portion of his estate was sacrificed. Died in New York.

LEWIS, Right Hon. Sir GEORGE CORNEWALL, Bart., English statesman and author, was b. in London, 1806. He was eldest son of sir Thomas Frankland Lewis, first baronet of Harpton Court, Radnorshire, who, after a long official career, was chairman of the poor-law board from 1834 to 1839. Lewis was educated at Eton and Christ church, Oxford, where in 1828 he was first-class in classics and second-class in mathe-

matics. He was called to the bar of the middle temple in 1831, and after acting on various commissions of inquiry, succeeded his father as poor-law commissioner in 1839, and remained at the poor-law board until it was broken up and reconstituted in 1847. He had meanwhile married lady Maria Theresa, sister to the fourth earl of Clarendon, and a connection by marriage of earl Russell. Having determined to adopt a political career, and being thus incorporated into the number of whig official families, his promotion was certain and rapid. He sat for Herefordshire from 1847 to 1852, and became successively secretary to the Indian board of control, under-secretary for the home department, and financial secretary to the treasury. In 1852 he lost his seat in the house of commons, and subsequently accepted the editorship of the *Edinburgh Review*, which he continued to conduct until 1855, when he was elected for the Radnor district of boroughs. He had scarcely taken his seat when lord Palmerston offered him the chancellorship of the exchequer in his first administration, which he held from Mar., 1855, to the dissolution of the government in Feb., 1858. On the return of lord Palmerston to power, in June, 1859, Lewis accepted the post of secretary of state for the home department, which, to the surprise of the nation, he exchanged, in 1861, on the death of lord Herbert, for the office of secretary of state for war. In the same year, he published a work of much research, entitled the *Astronomy of the Ancients*. This unremitting labor weakened his frame, and a cold caught while he was enjoying the Easter holidays at his family seat, was followed by congestion of the lungs, which proved fatal, April 13, 1863. Lewis was an able, earnest, and sincere politician. As an orator, he could scarcely be said to express himself with eloquence or vivacity; yet his sound sense, varied knowledge, and moral and intellectual qualities, made him one of the chief ornaments of public and political life in England. His *Inquiry into the Credibility of Early Roman History* is conducted on the critical principles of Niebuhr, but is more rigorous and skeptical in spirit than the work of the great German historian. The treasures of varied knowledge and wisdom which he had collected during his comparatively short life may be gathered from a list of his works, which include a treatise on the *Origin and Formation of the Romance Language*; *The Fables of Babrius*; *The Use and Abuse of Political Terms*; *The Influence of Authority in Matters of Opinion*; *The Method of Observation and Reasoning in Politics*; *Local Disturbances and the Irish Church Question*; *The Government of Dependencies*; *A Glossary of Provincial Words used in Herefordshire*; and the *Astronomy of the Ancients*. His latest work was a *Dialogue on the Best Form of Government*, which was published a few days before his death.

LEWIS, JOHN FREDERICK, b. London, 1805; became known at first by a series of studies from wild animals which were engraved by himself, and next by sketches of manners in Spain, published in 2 vols. in 1833-34. He resided most of the time in Italy 1838-51, but made visits to Greece, Turkey, and Egypt. In 1853 he exhibited copies in water-colors of more than 60 of the most famous pictures of the Venetian and Spanish schools. These were purchased by the Scottish academy. He was president of the society of water-colors, 1855-58; in 1859 he was elected an associate, and in 1865 a member, of the royal academy.

LEWIS, MATTHEW GREGORY, 1775-1818; often called monk Lewis; b. London; educated at Christchurch, Oxford; visited Germany for the purpose of acquiring the language of that country, and by the perusal of the drama and the wild fictions of the Germans, imbibed a taste for the mysterious and tragic. In 1795 he produced his novel the *Monk*, a work full of scenes of blood, cruelty, and impurity. It became very popular, but its licentiousness was so revolting that he was threatened with prosecution, to avert which he agreed to recall the printed copies, and remove the objectionable parts in future editions. He obtained a seat in parliament. In 1796 appeared *Village Virtues, a drama*; in 1797 his *Castle Specter*, which was acted 60 nights. In 1798 he visited Edinburgh, and had an interview with sir Walter Scott, who contributed several fine ballads to the *Tales of Wonder*, published by Lewis in 1801. The death of his father brought him a large fortune consisting of an estate and slaves in the West Indies, which he visited in 1815-16. On his homeward voyage the second time he died of fever. His novels and plays are all characterized by an extravagant taste for deeds of horror and mystery. His poetry, consisting chiefly of songs and ballads, though pronounced deficient in passion and imagery, has a finished and musical flow of versification, and by sir Walter Scott was warmly commended. His best known poems are *Alonzo the Brave*; *Durandarte*; *The Flair Imogene*. His novel *The Bravo of Venice* and his drama *Timour the Tartar* were popular. His best prose work is his *West Indian Journal*, written during his first voyage, published in 1833; and his *Life and Correspondence*, in 1839, shows him to have been a kind and benevolent man.

LEWIS, MERIWETHER, 1774-1809; b. near Charlottesville, Va.; a volunteer at the time of the whisky insurrection of 1794, an ensign in the regular army in 1795, and a capt. in 1800. Shortly afterwards he became Jefferson's private secretary. In 1803-6 he was engaged with capt. William Clarke in an expedition to the Pacific ocean, whose results were important to geographical science; and in 1807 he was made governor of the territory of Louisiana. He was subject to periods of mental depression, in one of which he took his own life near Nashville, Tenn. His memoir by Jefferson was pub-

lished, together with Biddle and Allen's *Narrative of the Lewis and Clarke Expedition*, in 1814.

LEWIS, MORGAN, 1754-1844; b. New York city; graduated at Princeton in 1773, and studied law in the office of John Jay. He joined Washington's army at Cambridge in June, 1775, and was successively made capt., maj., col., and chief of staff to gen. Gates. He was in the battle of Saratoga, and in Clinton's campaign against sir John Johnson in the Mohawk valley. After the war he was admitted to the bar in Dutchess co., was appointed judge of the court of common pleas, elected attorney-general in 1791, made judge of the supreme court in 1792, and chief-justice in 1801. He was governor of the state 1805-6, a member of the legislature 1808-11, quartermaster-gen with the rank of brig. gen. in 1812, maj. gen. in 1813, in which year he was engaged in the operations on the Niagara frontier, and in 1814 had command of the defenses of New York city. He delivered an address before the city authorities on the centenary anniversary of Washington's birth, Feb. 22, 1832, and was subsequently elected president of the New York historical society. Died in New York.

LEWIS, TAYLER, LL.D., 1802-77; b. Northumberland, Saratoga co., N. Y.; graduated at Union college in 1820. He studied law in Albany and entered into practice at Fort Miller; but finding the profession distasteful, relinquished it to devote himself to classical studies. He was appointed professor of Greek at the university of New York in 1838, and at Union college in 1849. He was a stout defender of evangelical theology against all its assailants, and especially against the theories and alleged discoveries of modern scientists. He was master of a most clear and vigorous English style, and full of learning and logical power. His mind was of great breadth and originality, and with that felicitous tendency to mysticism which, when restrained, gives depth and grandeur to explorations after truth. He wrote *The Six Days of Creation*; *The Bible and Science*; *The Divine Human in the Scriptures*; and, together with E. W. Blyden and Theodore Dwight, *The People of Africa, their Character, Condition, and Future Prospects*. He was a copious contributor upon his favorite themes to the periodical literature of his time. Died at Schenectady.

LEWIS, THOMAS, 1718-90; b. Ireland; was a member of the Virginia house of burgesses, and actively favored the rights of the colonies. In the session of 1765 he advocated the resolutions of Patrick Henry, was a member of the conventions of 1775-76, and of the state convention which ratified the federal constitution.

LEWIS, WILLIAM, 1724-1811; b. Ireland; one of four brothers prominent in the revolutionary history of Virginia. Under his brother Andrew, the most distinguished of the four, he was engaged in the French and Indian wars. He became a colonel.

LEWIS, WINSLOW, 1799-1875; b. Boston; graduated at Harvard university in 1819. continued his medical studies under Dupuytren at Paris and Abernethy at London. On his return to Boston he succeeded Dr. John C. Warren as consulting physician to the Massachusetts general hospital. In 1861 he was city physician of Boston. He took an interest in public affairs, and was several times chosen to the state legislature.

LEWIS AND CLARKE, a w. central co. of Montana; 2,819 sq.m.; pop. '80, 6,521: has the Missouri river on the e. and the Sun or Medicine river on the north. Within this co. is a part of the Rocky mountain chain, and the surface is generally mountainous, though there are productive valleys. There are gold mines, and the forests yield largely of fir and pine. The Utah and Northern railroad, now constructed to Red Rock, Montana, will probably penetrate this county. Co. seat, Helena

LEWISBURG, a borough in e. Pennsylvania, on the w. branch of the Susquehanna; pop. '78, 3,121. It is situated on the w. bank of the river, which is here spanned by a bridge, and has a delightful environment, its site being where the Buffalo creek empties into the Susquehanna. It is the terminus of the Lewisburg and Tyrone railroad, in Union co., 63 m. n. of Harrisburg, 14 m. w. of Danville, and 1½ m. from Montandon, connecting at that point with the Philadelphia and Erie railroad. It contains Lewisburg university, a Baptist institution organized in 1847, and the University institute for women. It has a town-hall, 2 weekly newspapers, 2 national banks, and 8 churches. It has manufactories of woolen goods, flour, lumber, and agricultural implements, and 2 foundries. It is the center and shipping point for a large trade in the productions of the neighboring country, which are principally grain and market produce.

LEWISIA, a genus of plants of the natural order *portulacaceæ* (see PURSLANE), named in honor of the American traveler Lewis. *L. rediviva* is found in the regions of his explorations on the w. side of the Rocky mountains. Its roots are gathered in great quantities by the Indians, and are highly valued as nutritive, and also as restorative, a very small quantity being deemed sufficient to sustain a man throughout a long journey and much fatigue. It is called *tobacco root* because, when cooked, it has a tobacco-like smell.

LEWISTON, a t. of Maine, on the Androscoggin river, 33 m. n. of Portland. The river has here a fall of 50 ft. in 200, and the water-power is distributed by a dam and canal to numerous manufacturing companies, large saw mills, etc. There are several churches, newspapers, schools, and a college. Pop. '70, 13,600.

LEWISTON (*ante*), a t. in s.w. Maine, 30 m. s.w. of Augusta, incorporated 1795; city charter granted, 1861; city government organized, 1863; the terminus of the branch railroad from Crowley's junction to Lewiston, and is on the Maine Central railroad, connecting with the Grand Trunk and the Boston and Maine by way of Auburn and Danville; pop. '80, 19,083. It is in the co. of Androscoggin, and is a manufacturing town of importance. It is connected with the w. bank of the river by four bridges, two of which are of iron for the use of the railroads, and its prosperity, in manufactures and trade, has given it the rank and consequence of the second city of Maine. It contains Bates college, a Free-will Baptist institution organized in 1863, named in honor of Benjamin E. Bates of Boston, who gave it \$200,000; a theological school connected with the college, organized 1870; and the Nichols Latin school, named from Lyman Nichols of Boston, connected with the same institution. It has a public library of more than 6,000 volumes, 13 churches, 3 newspapers, including the *Lewiston Evening Journal*, and a monthly magazine, published by the college students, a fine building for city offices, an elegant city hall, excellent public schools, with substantial edifices, a soldiers' monument in the park, and gas-works. It has 2 national banks, one with a capital of \$400,000, and 3 savings banks. The construction of the dam cost \$1,000,000, the water-power, including the canal, 60 ft. wide, being owned by the Franklin company, incorporated in 1854. It has 18 manufacturing corporations, employing 8,500 hands, with a capital of \$9,000,000, and an annual product of \$11,000,000. Number of yards of cotton and woolen goods manufactured annually, 40,000,000. Number of spindles, 285,000; other industries are the manufacture of cotton and woolen machinery for factories, brushes, boots and shoes, files, trunks, ticking, burlaps, jute bags, and duck. Its bleaching and dye-works are managed with a capital of \$300,000, employing 280 hands. It has many attractions for the tourist in its fine natural scenery.

LEWISTON, a t. in n.w. New York, on the New York Central and Hudson River railroad; the terminus of the Buffalo to Lewiston branch of that railroad, and also of the Oswego to Lewiston branch of the Rome, Watertown and Ogdensburg railroad; pop. '70, 2,829. It is in Niagara co., on Niagara river, 7 m. s. of the falls, the river descending 104 ft. in that distance. It was burned by the British in 1815, and is opposite Queenston, the scene of the battle of Oct. 13, 1812, at which gen. Isaac Brock, a British maj.gen., was killed. It has a Roman Catholic theological school, organized in 1856 and chartered in 1863, called Our Lady of the Angels, and 4 churches. It is situated at the foot of Mountain Ridge, formerly a reservation of the Tuscarora tribe of Indians, who are now numbered among the inhabitants. It is at the head of navigation from lake Ontario, and has a regular daily line of steamers in the summer season to the Canadian city of Toronto.

LEWIS-WITH-HARRIS (the name Lewis is derived from the Norwegian *Ljodhhus*, the sounding house), an island of Scotland, one of the outer Hebrides, the most northern and the largest of the group, lies about 30 m. n.w. from Ross-shire, from which it is separated by the Minch (q.v.). Lewis, the larger and most northerly part of the island, belongs to Ross-shire; the other portion, Harris, belongs to Inverness-shire. Entire length, 60 m.; greatest breadth, 30 miles. Area, 770 sq.m.; pop. '71, 25,947. The coasts are wild and rugged; the chief indentations being Broad bay, lochs Erisort, Seaforth, Resort, and Roag. The butt of Lewis, a promontory at the extreme n., in lat. 58° 31' n., long. 6° 15' 30" w., rises 142 ft. above sea-level. The surface is rugged, with tracts of swamp, a considerable portion is covered with peat, and there are remains of ancient forests. Barley and potatoes are the principal crops raised. Remains of ancient edifices abound on the island. The inhabitants are almost all of Celtic extraction, with the exception of a colony in the n., who, although they speak the Gaelic language, are of purely Scandinavian descent. Stornoway, on the e. coast, is the principal town. Near it is Stornoway castle, the seat of sir James Matheson, bart., who, as proprietor of Lewis, has expended large sums in various kinds of improvements. Stornoway is visited by steamers from Glasgow. See HEBRIDES.

LEX FORI, a legal expression often used to denote the law of the country where a suitor brings his action or suit. See INTERNATIONAL LAW.

LEXICON. See DICTIONARY.

LEXINGTON, a co. in central South Carolina, having the Congaree river for its e. boundary, the Broad river for its n.e., the North Edisto for its s.w.; intersected in the n. by the Saluda river, emptying into the Congaree at Columbia on its e. border; 750 sq.m.; pop. '80, 18,590—18,553 of American birth, 7,476 colored. It is traversed by the Charlotte, Columbia and Augusta railroad. Its surface is uneven, and is covered with extensive forests of hardwood timber. Its soil is adapted to the raising of live stock, every variety of grain, tobacco, cotton, wool, sorghum, and sugar-cane. It produced in '70, 7,980 lbs. of honey. Its industries are represented by cotton factories, carriage shops, flour and saw mills. Seat of justice, Lexington Court-House.

LEXINGTON, a city of Kentucky, on the Town Fork of the Elkhorn, a tributary of Kentucky river, 77 m. e. of Louisville. It is a handsome city, surrounded by a country of great beauty and fertility. Its principal edifices are a court-house, the state university, state lunatic asylum, city hospital, orphan asylum, banks, 18 churches. There are

4 newspapers, and many manufacturing establishments, mostly of hemp and tobacco. The town was being laid out when news arrived of the skirmish at Lexington, 1775, when the name was adopted. It has a beautiful cemetery, with a handsome monument to Henry Clay. Pop. '70, 14,801.

LEXINGTON (*ante*), a city in n. Kentucky, founded by col. Robert Patterson in 1775; incorporated in 1782; at the junction of the Cincinnati Southern railway, the Kentucky Central, and the Louisville, Cincinnati and Lexington railway. It is in Fayette co., 29 m. s e. of Frankfort, 77 m. s. of Cincinnati, and was formerly the capital of the state. It is the seat of Transylvania university, founded in 1798, now absorbed in the Kentucky university, which was chartered in Harrodsburg in 1858, and removed here in 1865. This institution has a library of 20,000 vols., and under its jurisdiction are a law school, an agricultural and mechanical college (embracing the Ashland estate, the home of Henry Clay), and a college of arts and a commercial college. The city has an elegant post-office, a public library of 16,000 vols., 1 state bank with a capital of \$550,000; 3 national banks with an aggregate capital of \$900,000; 8 newspapers, including 1 daily, 4 weekly, 2 semi-weekly; and an agricultural monthly magazine. Its leading industries are the manufacture of bagging and carriages; it has also gas-works, distilleries, and rope-walks. Its trade is supplied by the productions of a remarkably fertile country, for which it affords convenient facilities for transportation throughout the state. It has 2 private Roman Catholic schools, 5 seminaries for girls, the Lexington Baptist college for women, St. Catherine's academy (Roman Catholic), Christ church seminary (Episcopal), the Hocker college for women, and the Sayre institution. It has 7 public schools, where white and colored children are educated separately.

LEXINGTON, a small village of Massachusetts, 10 m. n.w. of Boston, celebrated as the scene of the first conflict between the colonists and British troops in the war of independence, April 18, 1775. Pop. of township '70, 2,277.

LEXINGTON (*ante*) was settled in 1642, and named after a t. in Nottinghamshire, Eng. It is celebrated in American history for having been the scene of the first battle in the revolutionary war, fought April 19, 1775, which aroused the colonies to resistance, precipitating the general conflict. On the night of April 18 the patriots discovered the intention of the British to send a detachment of troops to Concord, for the purpose of destroying some military stores which had been collected there, and also to seize the persons of John Hancock and Samuel Adams, who were residing at the house of the rev. John Clark in Lexington. Information of this design was spread abroad by Paul Revere, who rode from Charlestown to Lexington, warning the farmers along his route. On the same evening, gen. Gage, who commanded in Boston, had picketed the roads in the vicinity, and dispatched lieut.col. Smith, with 800 men, on the expedition to Concord. Revere eluded the pickets, and succeeded in his mission, so that when the advance of the British column reached Lexington it was opposed in the early morning by about 70 militia, who had formed on the town common, under command of capt. John Parker. The British were commanded by maj. Pitcairn, who, on observing the preparations made to resist his progress, halted his men to load, and then advanced them at the double-quick; himself riding in front and ordering the Americans to lay down their arms and retire. As the militia held their ground, maj. Pitcairn fired his pistol at them, and giving the order to his men, the latter discharged their muskets, with the result of killing four and wounding nine of the militia-men. The latter, being outnumbered, retreated, four being killed while flying. A scattering fire from capt. Parker's men wounded three British soldiers and maj. Pitcairn's horse, and, the militia being dispersed, the British force proceeded to Concord to effect the main object of the expedition. The distance is only about 2 m., and the place which became the second battle-ground of that day was reached at about $7\frac{1}{2}$ o'clock. The country was by this time thoroughly aroused, and as many as 180 militia had assembled, who, as the British came in view, fell back and took position on the side of a hill, afterwards crossing the north bridge by order of col. Barrett, who had assumed command. The British, being left in possession of the town, proceeded to the destruction of such arms and provisions as they could find, a detachment being sent to gain control of the bridges. This body was attacked by the militia, and a brisk fight followed, which resulted in slight losses on both sides. The British, having effected all the damage possible, commenced to retreat, being followed by the Americans, who kept up a galling fire, and annoyed them seriously during their hurried flight. The importance of these two engagements was quite disproportionate to their immediate result in killed and wounded. They fired the souls of the patriots and impressed them with the sense of their own capacity to contend with the tried regulars of the British army, and may thus be said to have had an influence and effect beyond their merits as warlike achievements.

LEXINGTON, a t. of Missouri, on the right bank of the Missouri, 350 m. above St. Louis. It has 11 churches, 4 newspapers, and 4 banks. It was the scene of repeated conflicts during the war of secession. Pop. '70, 6,336.

LEXINGTON (*ante*), a t. in w. Missouri, settled in 1837; terminus of the Lexington to Sedalia branch of the Missouri Pacific railway, and the Kansas City and Eastern railway; the St. Joseph to Lexington branch of the Wabash, St. Louis and Pacific railway has its

terminus at North Lexington, across the river. It is the seat of justice of Lafayette co. on the southern bank of the Missouri river, near one of its most abrupt bends. The river being very tortuous it is 84 m. by water to Kansas City, lying directly w. of it, and but 42 m. by rail. It is 55 m. n. of Sedalia, and 40 m. e. of the Kansas line. It is built on a bluff 300 ft. high, and has a court-house and 2 seminaries for girls. Its leading industries are the manufacture of furniture and woolen goods. Hemp is extensively raised in its vicinity, coal is mined, and the trade on the river is brisk. There is a hill at the n.e. of the town where, in Sept., 1861, 2,800 union soldiers, under col. James Mulligan, sustained a prolonged siege against 25,000 soldiers of the confederate army, under gen. Sterling Price, at last surrendering the town and garrison, but on Oct. 16 the union forces, in command of maj. Frank J. White, gained possession of the town. In 1864 it was the scene of a skirmish between the forces of gen. Blunt and gen. Price.

LEXINGTON, a t. in central Virginia, in Rockbridge co., 110 m. w. of Richmond, 32 m. n.w. of Lynchburg; in the fertile valley of the Blue Ridge; pop. '70, 2,873—891 colored. It is situated on the North river, a tributary of the James, having a salubrious climate and delightfully picturesque surroundings. The foot hills in its vicinity contain deposits of sulphur ore, its meadows afford an abundance of nutritious grass, and the soil yields a liberal crop of cereals. Within a convenient distance are a number of sulphur springs, and groves of useful timber and ornamental trees add to the beauty and advantage of the town. It is the terminus of a branch of the James River and Kanawha canal, 20 m. in length. It is the seat of the Washington and Lee university, established by Robert Alexander in Augusta co.; removed in 1785 to this vicinity; named in honor of George Washington in 1796. Having been reorganized in 1865, in 1870 it added the name of Lee, in honor of gen. Robert E. Lee, its president in the years immediately following the close of the rebellion. It includes the Virginia military institute, founded in 1839 as a military and scientific school, having a state annual appropriation of \$15,000; the state appointing 50 cadets annually; its cemetery is the burial place of gen. Stonewall Jackson and gen. Robert E. Lee. It has 7 churches, 3 hotels, 1 bank, 2 newspapers, 1 weekly and 1 semi-monthly, a public library, flour and saw mills, and an iron foundry.

LEX LOCI, a legal expression to denote the law of the country where a particular act was done, or where land is situated. See INTERNATIONAL LAW.

LEX LOCI (ante). See CONFLICT OF LAWS; FOREIGN COURTS.

LEX NON SCRIPTA, the unwritten law, an expression often applied to the common law, or immemorial custom.

LEX REI SITÆ. See CONFLICT OF LAWS; FOREIGN COURTS; INTERNATIONAL LAW.

LEX TALIONIS, the law of retaliation, common among all barbarous nations, by which an eye for an eye and a tooth for a tooth was considered the appropriate punishment. The doctrine is repudiated by all civilized countries.

LEYDEN (Fr. *Leyde*, the *Lugdunum Batavorum* of the Romans, originally *Luijkduin*, from *luijk*, an end, and *dun*, a hill; during the middle ages, *Lugduin* or *Leydis*), a celebrated seat of learning in Holland, situated on the Old Rhine, 22 m. s.w. of Amsterdam, and 17 n. of Rotterdam. Pop. Jan. 1, '75, 40,249. It is the oldest town in Holland, and has space for three times its present population. In 1640 Leyden contained 100,000 souls; in 1750 the numbers had fallen to 70,000; and at the beginning of the present century to 30,000. Since 1830 trade has again begun to flourish, and the population to increase. The streets are wide, the public buildings beautiful, and the canals broad and numerous. Within the city are the ruins of an old castle, called the "burg," supposed to have been built by the Romans before the birth of Christ. The principal manufactures are linen cloths, calicoes, woolens, but on a very small scale, as compared with former times. There is a considerable weekly market, for the whole of that part of Holland called Rhineland, held at Leyden, at which much butter and cheese change hands. But the chief ornament and glory of the city is its university—once unsurpassed by any in Europe. The origin of the university is well known. In 1574, when Holland was struggling to throw off the yoke of Spain, Leyden was besieged by the Spaniards, and had to endure all the horrors of famine. For 7 weeks the citizens had no bread to eat, and multitudes perished of hunger. The heroic burgomaster, Pieter Adriaanszoon Van der Werff, even offered his body as food to some who were imploring him to capitulate. At last the prince of Orange broke down the dikes, flooded the country, drowned a great number of the Spaniards, and relieved the inhabitants. The prince of Orange now offered, as some compensation for their unparalleled sufferings, either to remit certain taxes or to establish a university in the city. The Leydeners nobly chose the latter, which was inaugurated by prince William in 1575. Many eminent men from all countries of Europe have been connected with it, both as professors and students. We may mention Scaliger, Gomarus, Arminius, Grotius, Descartes, Boerhaave, Camper, Spanheim, Ruhnken. When it recently celebrated, with befitting solemnities, its three hundredth anniversary, the university had between 20 and 30 professors and upwards of 800 students, of whom about half are law students. It possesses a valuable library, with many rare MSS.; a magnificent collection in medicine; a botanical garden, valuable for its tropical plants; a museum of natural history, one of the richest in Europe; and

another equally fine of comparative anatomy. The museum of antiquities is also excellent. On Jan. 12, 1807, the most beautiful quarter of the city was destroyed, and many lives lost, by the explosion of a ship's cargo of gunpowder, and the site of the ruined streets is now a plain on which the troops are exercised.

LEYDEN, JOHN, a poet and orientalist of some celebrity, was b. at Denholm, a village of Roxburghshire, Scotland, Sept. 8, 1775. His parents were in humble circumstances; but seeing his desire for learning, they made an effort for his education; and after passing through the ordinary course of study in the university of Edinburgh, he was licensed as a preacher or "probationer" of the church of Scotland. During the years of his university course, he had, however, learned much that formed no necessary part of it, and in particular, several of the languages of modern Europe, and some of the oriental languages. He was a most ardent and enthusiastic student. His varied gifts and attainments soon recommended him to the attention of some of the most eminent men of the time in Edinburgh. In 1799 his first work issued from the press, *A Historical Account of the Discoveries and Settlements of Europeans in Northern and Western Africa*. About this time, also, he contributed many translations from the northern and oriental languages, and original poems to the *Edinburgh Magazine*. He contributed to Lewis's *Tales of Wonder*, and aided Scott in amassing materials for his *Minstrelsy of the Scottish Border*. He was editor for one year of the *Scots Magazine*. In order to obtain opportunity of gratifying the strong desire which he felt to visit oriental countries, he studied medicine, and in 1802 sailed for India, having received the appointment of assistant-surgeon on the Madras establishment. Before leaving his native country he completed his *Scenes of Infancy*, a poem containing much that is beautiful; but on which, however, his reputation does not rest so much as on his minor pieces, and particularly his ballads. After his arrival at Madras, his health soon gave way, and he was compelled to remove to Penang, where he ardently prosecuted the study of the language, literature, history, etc., of the Indo-Chinese tribes. Having resided for a time in Penang, he left it for Calcutta, on being appointed a professor in the Bengal college; and he soon afterwards exchanged this office for that of a judge at Calcutta. When the expedition against Java was undertaken, Leyden obtained leave to accompany the governor-general thither; and at Batavia, in the exploration of a library which contained many Indian manuscripts in its musty recesses, he contracted a fever, of which he died after a few days' illness, Aug. 28, 1811. Leyden's versification is soft and musical; but "he is an elegant rather than a forcible poet." His attainments as an orientalist were extraordinary. The chief evidence extant of them, however, is an *Essay on the Languages and Literature of the Indo-Chinese Nations*, published in the *Asiatic Researches*. His *Poetical Remains* were published in 1819; and a new edition of his *Poems and Ballads*, with memoir by sir W. Scott, in 1858. A monument to Leyden was erected in Denholm. In 1875—his centenary—two new editions of his poems appeared.

LEYDEN, LUCAS VAN, one of the most celebrated painters of the early Dutch school, was born in Leyden in 1494. His talents, which were developed when he was very young, were first cultivated by his father, Hugo Jacobs, an obscure painter; but he was afterward placed in the school of Cornelius Engelbrechsten, an artist of repute in his day. He commenced engraving when scarcely nine years of age. His picture of St. Hubert, painted when he was only 12, brought him very high commendation; and the celebrated print, so well known to collectors by the name of "Mahomet and the Monk Sergius," was published in 1508, when he was only 14. He practiced successfully almost every branch of painting, was one of the ablest of those early painters who engraved their own works, and he succeeded, like Albert Dürer, in imparting certain qualities of delicacy and finish to his engravings that no mere engraver ever attained. The pictures of Lucas van Leyden are noted for clearness and delicacy in color, variety of character and expression; but his drawing is hard and gothic in form. Examples are to be seen in many of the galleries on the continent. His range of subjects was very wide, and embraced events in sacred history, incidents illustrative of the manners of his own period, and portraits. His engravings are very highly prized by collectors, and are ranked about as highly as those of Albert Dürer. He also executed some wood-cuts, which are very rare. Bartsch gives a list of 174 engravings by him. His habits were expensive. He seems to have occasionally entertained his brother-artists in a sumptuous manner; was on terms of intimacy with the celebrated painter, Jean de Mabuse, who is alleged to have been rather too fond of good living; and held friendly intercourse with Albert Dürer, whose talents he admired without professional jealousy. He married in early life a lady of the noble family of Boshagen, by whom he had one daughter. He died in 1533, aged 39. He had been confined to bed 6 years before his death, but contrived to paint and engrave till within a short period of his decease.

LEYDEN, SCHOOL OF, in theology, the name given to certain Dutch theologians who follow the rationalistic professors of the university of Leyden, founded in 1575. The principal advocates of this school are Abram Kuenen, Tiele, and J. H. Scholten, professors in Leyden, and their pupils. Their views are similar to those of the Dutch Tübingen school. Scholten in his younger days was orthodox, and strongly opposed the views of Baur and his associates, but in 1864 came out boldly in defense of them. "Man," the Leyden school teaches, "arrives at a knowledge of the truth by the holy

Scriptures; but they must not be understood as containing the only revelation from God. He also reveals himself to the world through the hearts of all believers. The Bible is the source of the original religion. There is a difference between the Scriptures and the word of God. The latter is what God reveals in the human spirit concerning his will and himself. The writing down of the communication is purely human; therefore the Bible cannot be called a revelation. To prove the certainty of the facts of revelation, historical criticism must be called in." But they assert, in applying "historical criticism," that we cannot go further back than the middle of the 8th c. before Christ, or the time of Hosea and Amos; that "all the preceding times are enveloped in hopeless myth. Abraham, Isaac, and Jacob, the founders of Israel, are not persons, but personifications. They are purely ideal figures, for modern historical inquiry teaches us that races are not derived from one progenitor, but many. The development and preservation of Israel—its whole history—were the result of purely national causes." Christianity they regard as "neither superhuman nor supernatural. It is the highest point of the development of human nature itself, and in this sense it is natural and human in the highest acceptation of those terms. It is the mission of science to put man in a condition to comprehend the divine volume presented by Christianity." And what the relation of science to faith is may be learned from Opzoomer, of Utrecht university, who says. "Science is not to appear before the bar of faith, but faith before that of science; for it is not the credibility of knowledge, but of faith, that is to be proved. Science needs no justification. The believer, on the contrary, must justify his faith, and that before the bar of science. Thus, as a matter of course, the final decision and the supreme power rest with science." This writer's arguments against miracles are precisely those of Hume. He says: "We know nothing of the supernatural; to us there is not a single miracle."

LEYDEN JAR. See ELECTRICITY.

LEYS, JEAN AUGUSTE HENRI, 1815-69; b. Antwerp. His artistic studies were pursued at first under the direction of Brakaleer, his brother-in-law, and when he was but 18 years of age he exhibited a picture, "Combat of a Grenadier with a Cossack," which attracted much attention. After this he studied for a time in France and Holland, and then returned to Antwerp, where he won great distinction. His subjects were taken in part from the history of his own country, and in part from the life of the middle ages, and his work is the result of careful research and high artistic feeling and insight. A grand medal of honor was awarded him for three pictures in the Paris exhibition of 1855. He was similarly honored for work exhibited in the exposition of 1867. In 1846 he was decorated with the order of Leopold, in 1851 raised to the rank of officer, and in 1867 appointed commander of the order and raised to the dignity of officer in the legion of honor. He was also created a baron by Leopold, and chosen a member of the royal academy of Belgium. Died in Antwerp.

LE'ZE MAJESTY, an offense against sovereign power—*læsa majestas*.

LHA-SSA, or **H'LASSA**. See LASSA.

L'HÔPITAL, or L'HOSPITAL, MICHEL DE, 1504-73; b. at Aigueperse, in the present department of Puy de Dôme; studied jurisprudence at Padua; in 1547 was sent by the French court to the council of Trent in Bologna; in 1554 was made president of the court of accounts, and in 1560 chancellor of France. His ability and integrity were acknowledged by all parties, but he made enemies among extreme Roman Catholics by his moderation, and especially by his successful efforts to secure the freedom of Protestant worship and prevent the establishment of the inquisition in France. In 1568 he resigned the office of chancellor and retired to his estate at Bellebat, in the present department of Seine-et-Oise, where he died. His memoirs, 4 vols., were published in Paris in 1824, and an edition of his poems appeared in 1827.

LI, the name of a Chinese measure of length. The li = .577 Fr. kilomètre = .358 (rather more than one-third) English mile.

LIABILITY (LIMITED) ACTS. See JOINT-STOCK COMPANIES.

LIABILITY, LIMITED (*ante*), a limited responsibility of parties to certain contracts. The limit of such responsibility is fixed by statutory provisions. The most common case of limited liability occurs in limited partnerships. Such a partnership is created by written contract; the parties to it are either general or special partners, and a public notice must be given of its creation, of the names of the partners, and of the amount of capital contributed by the special partner or partners; and this capital must be actually paid in. Any deviation from the statutory forms withdraws the partnership from the operation of the statute, and makes each partner liable for the partnership debts to the full amount of his property, as in the ordinary partnership at common law. A joint-stock company "limited" is much the same thing as a limited partnership, and the operation of the statutes in their regard limits the liability of each member to the amount of his share in the company's stock. See JOINT-STOCK COMPANIES (*ante*).

LIA'NAS, a term first used in the French colonies, but afterwards adopted by English, German, and other travelers, to designate the woody, climbing, and twining plants which abound in tropical forests, and constitute a remarkable and ever-varying feature of the

scene. Such plants are comparatively rare in colder climates, although the honeysuckles and some species of *clematis* afford familiar examples of them; but as these often overtop the hedges or bushes in which they grow, and fall down again by the weight of their leaves as their stems elongate, so the lianas of tropical countries overtop the tallest trees, descend again to the ground in vast festoons, pass from one tree to another, and bind the whole forest together in a maze of living network, and often by cables as thick as those of a man-of-war. Many parts of the forest—as in the alluvial regions of the Amazon and Orinoco—thus become impenetrable without the aid of the hatchet, and the beasts which inhabit them either pass through narrow covered paths, kept open by continual use, or from bough to bough far above the ground. Many lianas—as some of the species of *Wrightia*—become tree-like in the thickness of their stems, and often kill by constriction the trees which originally supported them; and when these have decayed, the convolutions of the lianas exhibit a wonderful mass of confusion magnificent in the luxuriance of foliage and flowers. No tropical flowers excel in splendor those of some lianas. Among them are found also some valuable medicinal plants, as sarsaparilla. The rattau and vanilla are lianas. Botanically considered, lianas belong to natural orders the most different. Tropical plants of this description are seldom to be seen in our hot-houses, owing to the difficulty of their cultivation.

LIAS. The lias is the lower division of the oolitic or jurassic period (q.v.). The beds composing it may be considered as the argillaceous basis of that series of rocks, consisting of more than a thousand feet of alternations of clay and limestone, with but a few unimportant deposits of sand. It consists of the following groups:

UPPER LIAS	Cephalopoda bed.	
	Lias sands.	
MARLSTONE.	Upper Shale.....	300 feet.
LOWER LIAS	Lower shale.	200 "
	Bone bed.....	600 "

The upper lias consists of thin limestone beds scattered through a great thickness of blue clay, more or less indurated, and so aluminous that it has been wrought for alum at Whitby. A thick band of vegetable matter or impure lignite occurs in this division, in which are found nodules and lumps of jet, a peculiar mineral composed of carbon and hydrogen, and probably having a similar origin to the amber of the tertiary lignites. A series of brown and yellow sands, and a peculiar layer called the cephalopoda bed, from the abundance of these fossils contained in it, occur above these clays; recently, they have been separated from the inferior oolite, and joined to this division, on the evidence of the contained fossils.

The marlstone is an arenaceous deposit, bound together either by a calcareous or ferruginous cement, in the one case passing into a coarse shelly limestone, and in the other into an ironstone, which has been extensively wrought both in the north and south of England.

The lower lias beds consist of an extensive thickness of blue clays, intermingled with layers of argillaceous limestone. In weathering, the thin beds of blue or gray limestone become light brown; while the inter-stratified shales retain their dark color, giving the quarries of this rock, at a distance, a striped or ribbon-like appearance, whence, it is supposed, the miner's name lias or layers is derived. Generally the clays rest on triassic rocks, but occasionally there is interposed a thin bed of limestone, containing fragments of the bones and teeth of reptiles and fish, generally of undoubted liassic age; occasionally, the bones of keuper reptiles are met with in it, causing it to have been referred to the trias.

The lias is highly fossiliferous, the contained organisms being well preserved; the fishes are often so perfect as to exhibit the complete form of the animal, with the fins and scales in their natural position. Numerous remains of plants occur in the lignite and in the shales. The name gryphite limestone has been given to the lias, from the great quantities of *grypheea incurvata*, a kind of oyster, found in it. Some of the older genera of mollusca are still found in these beds, but the general character of these animals more nearly approaches the newer secondary forms. Fish remains are frequently met with; the reptiles, however, are the most striking features. They are remarkable for the great numbers in which they occur, for the size which many of the species attain, and for the adaptations in their structure which fitted them to live in water. The most noteworthy are species of *ichthyosaurus* (q.v.) and *plesiosaurus* (q.v.).

The liassic rocks extend in a belt of varying breadth across England, from Whitby, on the coast of Yorkshire, s. to Leicester, then s.e. by Gloucester, to Lyme Regis in Dorsetshire.

LIBA'NIUS, one of the latest and most eminent of the Greek sophists or rhetoricians, was b. at Antioch, in Syria, about 314 or 316 A.D. He studied at Athens under various teachers, and first set up a school in Constantinople, where his prelections were so attractive that he emptied the benches of the other teachers of rhetoric, who had him brought before the prefect of the city on a charge of "magic," and expelled. He then proceeded to Nicomedia; but after a residence of five years, was forced by intrigues to leave it, and

returned to Constantinople. Here, however, his adversaries were in the ascendent; and after several vicissitudes, the old sophist, broken in health and spirit, settled down in his native city of Antioch, where he died about 393 A.D. Libanius was the instructor of St. Chrysostom and St. Basil, who always remained his friends, though Libanius was himself a pagan. He was a great friend of the emperor Julian, who corresponded with him. His works are numerous, and mostly extant, and consist of orations, declamations, narratives, letters, etc. The most complete edition of the orations and declamations is that by Reiske (4 vols. Altenb. and Leip. 1791-97), and of the letters that by Wolf (Amst. 1738).

LIBANON. See LEBANON.

LIBANUS, MOUNT. See LEBANON.

LIBATION (Lat. *libare*, to pour out), literally anything *poured out* before the gods as an act of homage or worship; a drink-offering. The term was often extended in signification, however, to the whole offering of which this formed a part, and in which not only a little wine was poured upon the altar, but a small cake was laid upon it. This custom prevailed even in the houses of the Romans, who at their meals made an offering to the Lares in the fire which burned upon the hearth. The libation was thus a sort of heathen "grace before meat."

LIBAU, a seaport of Courland, Russia, on the Baltic. 526 m. s.w. of St. Petersburg. It existed previous to the settlement here of the Teutonic knights, who surrounded the town with walls, and erected in 1300 a cathedral and a castle. In 1795 it was annexed to Russia. The port is open almost the whole year, but has only a small depth of water. Its inhabitants, since the 17th c., have devoted themselves to ship-building, and now furnish merchant-vessels to St. Petersburg, Riga, and Revel. In 1873 over 200 ships entered and as many cleared the port. The imports, amounting in value to 1,500,000 rubles annually, consist of salt herrings, wines, fruit, and colonial produce; the exports (about 5,000,000 rubles in value) are chiefly cereals, leather, flax, seeds, and timber. Pop. '67, 9,090.

LIBEL, in Scotch law and in English ecclesiastical law, means the summons or similar writ commencing a suit, and containing the plaintiff's allegations.

LIBEL is a publication either in writing, print, or by way of a picture, or the like, the tendency of which is to degrade a man in the opinion of his neighbors, or to make him ridiculous. When similar results follow from words spoken, the act is called slander (q.v.), which, however, is less severely punished. It is extremely difficult to define what amounts to libelous matter, for the question whether a publication amounts to libel must always be left to the decision of a jury, and this decision is somewhat uncertain, and varies with the popular mood for the time. But the test is, in point of law, whether there results degradation of character. There are two remedies in England for the wrong caused by libel; one is by indictment, the other is by action. If the offense is of a public nature, an indictment is generally resorted to, for every libel tends to a breach of the peace; or the libeled party applies to the court of queen's bench for a criminal information, which is a variety of indictment. When an action is brought, its object is to recover damages for the private injury sustained. The rule formerly was, in indictments and criminal informations, that the defendant was not allowed to plead in defense that the libelous matter was true. But the law was in 1843 altered, and the defendant is now allowed, in criminal as well as civil proceedings, to prove the truth, and that it was for the public benefit that the matter should be published, stating how. If, however, the jury by their verdict find otherwise, this defense often aggravates the punishment. The statute 6 and 7 Vict. c. 96 also improved the law of libel as regards editors, and proprietors of newspapers and periodical publications, who were formerly held liable for libels inserted without their knowledge. By the present law, the defendant may plead in defense that the article in question was inserted without actual malice and without gross negligence, and that, before the commencement of the action or at the earliest opportunity afterwards, the defendant inserted an apology, or if the periodical did not appear within an interval of a week, that he offered to publish an apology in any newspaper or periodical to be selected by the plaintiff. But the defendant, when he pleads this defense, must also pay into court a sum of money, by way of amends for the injury done. In these cases, even where the proceeding is by indictment or criminal information, the defendant, if he obtains a verdict, will (contrary to the general rule) be entitled to have his costs paid by the prosecutor. There are certain libels which are called blasphemous on account of their denying the fundamental truths of Christianity, and these are punishable by fine and imprisonment. So there are seditious, treasonable, and immoral libels, according to the nature of the subject-matter. If any person threaten to publish a libel, or offer to prevent such publication, with intent to extort any money, security, or valuable thing, or with intent to induce any person to confer or procure any appointment or office of profit or trust, he is liable to imprisonment with or without hard labor for three years. If any person maliciously publish a defamatory libel, knowing the same to be false, he is liable to two years' imprisonment and a fine; and the malicious publication, even though not with knowledge that it is false, makes the author liable to one year's imprisonment and a fine.

LIBEL (*ante*) is chiefly distinguished, in regard to legal remedy, from slander or spoken defamation by the fact that it may become the subject of criminal proceedings, its capability of indefinite repetition making it more dangerous and more likely to result in a breach of the peace than the former. With every sale of a book or paper containing libelous matter, the offense is renewed. If a libel appear in a newspaper or magazine, both editor and publisher are liable, even though the libelous article be accompanied by the name of its author. No proof of express malice in the publication is necessary, but malice may be implied. Formerly truth was no defense in an action for libel, but it is now a competent defense, the old rule of law having been changed by statute. When a person has occasion, in the discharge of some legal, social, or moral duty, to criticise the character or conduct of another, the communication in which he discharges such duty is called privileged, and is protected by the courts, and such protection is either absolute or relative. In the former instance, e.g., the proceedings of a court of justice, no action could be maintained; in the latter, e.g., a letter in regard to the character of a servant by a former employer, no action could be maintained unless express malice were proved. In a civil action of libel, if the words be clear, the judge determines whether they constitute a libel or not; but otherwise he must submit them to the jury. In a criminal prosecution for libel, the jury passes upon a mixed question of law and fact, viz., the proper meaning of the libelous words, and whether they constitute a libel. In many states the defendant is allowed both to set up a plea of justification, i.e., the truth of the alleged libel, and to put in evidence of the truth of the libel, in mitigation of damages; this rule has been criticised as really allowing the defendant two separate defenses, by one of which he admits the libel and by the other denies it. **LIBEL** (in practice) is the petition of a plaintiff addressed to an ecclesiastical or admiralty court, setting forth his cause of action and the nature of the relief he expects. It is the ordinary form for the beginning of an admiralty suit in the United States courts.

LIBEL'LULA AND LIBELLULIDÆ. See DRAGON-FLY.

LIBELT, KAROL, PH.D., b. Posen, 1807; studied mathematics and philosophy at Berlin, gaining a prize for his essay *De Pantheismo*. He was engaged in the Polish revolution of 1830, and after its failure retired to his estates in Posen, and devoted himself to periodical literature. He was arrested in 1846 for being concerned in the conspiracy of Mieroslawski, but liberated at the outbreak of the revolution at Berlin in 1848. He was a member of the Slavic congress at Prague in 1849, and a leader of the Polish fraction in the second Prussian chamber in 1859. His *Philosophy and Criticism*, in 5 vols., and his *Aesthetics*, in 3 vols., are his principal works. His philosophical works have been translated into German, and have attracted no little attention as able expositions of the German philosophy. He has also written a number of mathematical, economical, and agricultural essays and pamphlets.

LIBER. See BARK and BAST.

LIBER. See BACCHUS, *ante*.

LIBERALS, a name given first when lord Byron and his friends started the periodical called *The Liberal* to represent their views in politics, religion, and literature. The name since 1832 has been applied to the more advanced whigs and reformers. The party held office under earl Gray, viscount Melbourne, earl Russell, and viscount Palmerston. In May, 1874, the new city liberal club was organized with earl Granville as president, and a new liberal club for the west end was founded in June of the same year. Mr. Gladstone resigned the leadership of the party in 1875, and resumed it in Dec., 1879. As a party name this word *liberals* has been definitely adopted in Spain, where the party of the cortes assumed the title of *liberales*, and nicknamed their opponents by that of *serviles*.

Liberals in religion may include two classes; first, those who, like the German rationalists, reject the supernatural in revelation, accepting the historic Christ and his teachings as on the high plane of humanity; second, those who call themselves liberal Christians, as the modern Unitarians, who, admitting the supernatural, reject the vicarious atonement, the corruption of human nature, the necessity of regeneration, and (usually) the special inspiration of the Scriptures. Like the latitudinarians of the 16th c. and the modern broad church party, they consider dogma as unimportant, make much of the life and moral instruction of Christ, and are willing to fraternize with any who receive Christ as their teacher.

LIBERATION, in Scotch law, means discharge from imprisonment. Formerly, if a person was imprisoned for debt, and paid the amount, he had to present a bill of liberation and suspension to get out of prison, which is not now necessary.

LIBERIA, a negro republic on the grain coast of Upper Guinea. The territory of the republic extends from long. $5^{\circ} 54'$ to $12^{\circ} 22'$ west. The length of coast is about 500 mi., the average breadth of the territory about 50 miles. On Dec. 31, 1816, an association, of which Henry Clay (q.v.) was president, styled the American colonization society, was formed, for the purpose of founding a colony of emancipated negroes, and of giving them favorable opportunities of self-improvement. The first attempt failed, in consequence of the selection of an unhealthy locality; but in Dec., 1821, a treaty was concluded with the native princes, by which a tract of land fit for the purpose was

acquired. The association immediately commenced operations, and allotted to each man 30 acres of land, with the means of cultivating it. A town, called Monrovia, was founded at cape Mesurado; the boundaries of the colony were enlarged by the purchase of new tracts; and a second town, called Caldwell, in honor of the originator of the association, was founded upon the river Mesurado. New settlements were afterwards formed at cape Monte and in the newly acquired Bassa land, in which, in 1834, a town was founded, and called Edina, in acknowledgment of pecuniary aid sent to the colony from Edinburgh. Many of the neighboring chiefs were received into the colony, whilst others were subdued. In 1847, Liberia was left to its own resources, declared an independent republic, and the government committed to a president, senate, and house of representatives. The president and representatives are elected for 2, and the senators for 4 years, all citizens being qualified electors when they reach 21 years of age, and possess real estate. The judicial power is vested in one supreme and several subordinate courts. Slavery and the slave-trade are prohibited, and the right of petition established. Whites are excluded from rights of citizenship, but this is only a temporary measure. The prosperity of the colony soon became very obvious; churches and schools were founded in greater proportion to the population than in most parts of Britain or America; a regular postal system was established, newspapers published, and slavery in the neighboring states abolished. Negroes from the neighboring regions, settling in the republic and submitting to its laws, were admitted to participation in civil and political freedom equally with the colonists. The new republic was recognized by Britain in 1848, and since by other European powers. The British government made it a present of a corvette of war with four guns. The prosperity and usefulness of Liberia have since continued to increase, but the number of settlers from North America has never been great in any year, and the whole number in the country is reckoned not to exceed 19,000. Additional negro tribes, are, however, from time to time included within its territory. The native inhabitants of Liberia were recently estimated at 700,000, and about 50,000 had acquired the English language, of whom about 3,000 were members of the Christian church. Agriculture is carried on with increasing success. Sugar is the principal article of produce, and also of manufacture. Cocoa, cotton, coffee, arrow-root, and rice are also cultivated. Trade is rapidly extending, and palm-oil, ivory, gold-dust, camwood, wax, coffee, indigo, ginger, arrow-root, and hides are amongst the principal articles of export. The exports to the United States in 1869 were valued at £18,646. Revenue '75, £25,000.—See Stockwell's *Republic of Liberia* (New York, 1868); and *The Republic of Liberia*, by Blyden (*Methodist Quarterly Review*, New York, 1872).

LIBERIUS, a native of Rome, b. in the early part of the 4th c., succeeded to the see of Rome in 352, on the death of pope Julius I. His pontificate falls upon the stormiest period of the semi-Arian controversy. See **ARIUS**. The emperor Constantius supported the semi-Arian party with all his authority; and the council of Arles in 353, and that of Milan in 355, formally condemned Athanasius (q.v.), the great representative of the orthodox belief. Liberius refused to confirm this decree, and, even in opposition to the personal commands of Constantius, withheld his subscription. He was, in consequence, in common with several others, deposed and banished to Berœa by the emperor, who caused a Roman deacon, Felix, to be elected in his stead. The later history of Liberius is a subject of controversy. He was restored to his see in 358, but the terms on which he was recalled are much disputed. He survived his return from exile 8 years, and died in high repute for sanctity at Rome in 366. His only remains are some letters preserved by Constant in the *Epistola Romanorum Pontificum*. During his life, many spurious letters and decrees were circulated in his name.

LIBER PONTIFICALIS, part of the title of a history of the bishops of Rome professing to begin with the apostle Peter and extending to Nicolas I. (867 A.D.), with an addition subsequently made of the times of Adrian II. and Stephen VI. (891). Anastasius, librarian of the church under Nicolas I. and abbot of a convent in Rome, was formerly supposed by many to be the author of the book; but later investigations have shown almost certainly that it existed before his time. The oldest materials now known that were used in the compilation of it were furnished by a list of the popes down to Liberius, which was probably written before his death (366). The original MS. has been lost, but several copies of it, taken in the 17th c. from other copies, are extant. Another list of the popes comes down to Felix IV. (530). Parts of it are almost literal copies from the former, but many additional particulars are given, drawn from various sources and having different degrees of historical value. Both lists were afterwards continued and ultimately formed the Liber Pontificalis, the oldest known copy of which belongs to the end of the 7th or the beginning of the 8th century. A first continuation of it extends to Gregory II., who became pope in 714, and a second ends with Stephen III., 757. After this time several other continuations were made, the latest of which terminates, as has been mentioned, with Stephen VI., 891. Besides the sources already spoken of, materials for the history were furnished by traditions, written documents, buildings, inscriptions, and other monuments. Additions to the book have been made: 1. By three histories of the popes, the authors of which are not known, (1) from Laudo, 912, to Gregory VII., and belonging to the 11th c.; (2) extending down to the same date, and written during Gregory's life; (3) from Paschal II., in the early part of the 12th century. 2. By a his-

tory written in the 13th c., extending from Gregory VII. to Honorius II. 1129. 3. By histories originating at the close of the 12th century.

LIBERTINES, THE, or SPIRITUALISTS, an odious and pernicious sect that sprang up in the 16th c. in the reformed church of France. They arose in Flanders. Calvin mentions Coppin of Lille, who first attempted to introduce the doctrines of the Free Spirit in his native city in 1529. Quintin and a priest named Pocques or Pockesius became the leaders in France in 1534. They are said to have made 4,000 proselytes in France alone, and not only among the lower classes, but also among the higher and learned. They obtained the favor and protection of Margaret, queen of Navarre, sister to Francis I., and found patrons in several of the reformed churches. They called themselves Libertines and Spiritual brethren and sisters. They themselves published no account of their tenets, but, so far as they can be ascertained from the writings of Calvin, their doctrine is about as follows: That the Deity is the sole operating cause in the mind of man, and the immediate author of all human actions; that consequently the distinction of good and evil with regard to these actions is false and groundless, and that men cannot, properly speaking, commit sin; that religion consists in the union of the spirit or rational soul with the Supreme Being; that all those who have attained this happy union, by sublime contemplation and elevation of mind, are then allowed to indulge, without exception or restraint, their appetites and passions; that all their actions and pursuits are then perfectly innocent; and that after the death of the body, they will be united to the Deity. Their system was pantheistic and antinomian. From being a mere dogma, it degenerated into open and avowed sensualism. Calvin sternly denounced their principles, and it was because of his efforts that this sect left France, took refuge in Belgium, and at last entirely disappeared. In Geneva they made an insurrection May 15, 1555, when their principal leaders were exiled or imprisoned. Dr. Mosheim considers these Libertines or Spirituals as a remnant of the ancient *Beghards* or Brethren of the Free Spirit. This name in England was given to the early Anabaptists about the middle of the 16th century.

LIBERTY, in English law, is often used to denote a franchise, or portion of the royal prerogative delegated to a subject; also a privileged district in a county exempt from the sheriff's jurisdiction.

LIBERTY, EQUALITY, FRATERNITY. For nearly a century, these three words have been accepted as embodying the creed of those who maintain the rightful supremacy of the numerical majority; and they have been sounded as the watchword of that formidable movement known on the continent of Europe as "the Revolution," of which the object is to assert this supremacy by overturning the existing fabric of society. When contrasted with the democratic creed of antiquity, the only novelty which the modern symbol exhibits consists in the proclamation of "equality;" for "liberty," in the widest sense—meaning thereby the ultimate extension of political power to the whole body of the citizens—has been the object of the most enlightened politicians of all ages; whilst the protest in favor of "fraternity" is a mere sentimental commonplace, about the speculative soundness of which there never was any real difference of opinions.

The first state document of importance in which the doctrine of equality is set forth is the American declaration of independence of July 4, 1776. This celebrated document proceeds thus: "We hold these truths to be self-evident: *that all men are created equal;* that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness," etc. This, as we have said, was in 1776. But as a speculative opinion, the doctrine of equality had been proclaimed by Hobbes more than a century before, and from his time down to the period at which it thus received practical recognition, it had never been lost sight of by the class of speculators to which Hobbes belonged. Under different forms and from various points of view, it had been reasserted by Spinoza, Rousseau, Helvetius, and ultimately by the class of political declaimers whose works were simultaneous with the American, and immediately preceded the French revolution.

Hobbes was bolder than his followers, and by assuming a premise which, had it been true, would certainly have justified his conclusion, saved his logic, though he did not secure a very stable foundation for his law. He asserted that men are not only born, but continue in essentials very nearly equal. "Nature," he said, "has made little odds among men of mature age as to strength and knowledge." Rousseau, on the other hand, feeling that subjective and objective experience would at once repudiate such an assumption, admitted the existence of inequalities in maturity, and scarcely ventured to deny them even at birth, but ascribed them mainly to education, and to other distorting and deranging principles in human nature and human society, which it is the object of law and government to counteract. A third class of reasoners, whilst admitting the fact of inequality, and not condemning it as abnormal in the case of individuals, asserted that the argument in support of social and political equality is sufficiently founded on the generic equality of mankind—on the proposition, viz., that *all men are equally men*. They forgot, or found it convenient to ignore, that the argument of their opponents rested on the proposition, that *all men are not equal men*; and consequently would not have been in the slightest degree affected even by the admission of the generic equality for which they contended. To this last class belongs prof. Ahrens, whose work on natural

law has been used as the text-book in the *Ecole de Droit* in Paris. But all these writers agree in maintaining the inalienable connection between equality and liberty; and in asserting that the realization of the latter must of necessity be in proportion to the completeness with which the former is realized. In Great Britain, hitherto, the opposite creed has prevailed. Experience, both subjective and objective, has led to the conclusion that, in point of fact, men come into the world and continue during the whole course of their earthly sojourn to be extremely unequal in strength, intelligence, virtue, and worth. It is on this assumption that the whole fabric of our liberties rests. So far from believing liberty to involve the fictitious recognition of an equality which does not exist, or the creation of an equality which is contrary to nature, we hold it to necessitate the recognition of the inequalities which nature has established, and which God as the author of nature has decreed. Nay, further, we conceive its perfection to be in direct proportion to the completeness with which these inequalities are recognized, and their consequences, in the shape of property, social position, and the like, are vindicated by the political machinery of the state. Society, in our view of the matter, is an organic structure, is cosmic, just in so far as it recognizes these inequalities; and begins to be inorganic, chaotic, the moment that it ignores them. In like manner, the political, which is the mirror of the social organization of the state, performs its appropriate function only when and in so far as it truly reflects the inequalities which society has recognized and sanctioned. It must neither add to nor take from the facts which society presents to it. To each it must assign his own, and nothing but his own; and his own politically is the place which society has already conceded to him. These views, which in a somewhat irregular manner have always been recognized and acted upon in England, have been thought out and systematized within these last few years by Mr. Mill and the class of politicians to whom in future the title of progressive conservatives will probably be applied. By no writer, perhaps, has the true doctrine been stated with greater force than by John Adams, the friend and successor of Washington, and second president of the United States. The following passage is selected from many to the like effect in the recent edition of his works by his grandson, Charles Francis Adams: "That all men are born to equal rights, is true. Every being has a right to his own as clear, as moral, as sacred, as any other being has. This is as indubitable as a moral government in the universe. But to teach that all men are born with equal powers and faculties, to equal influence in society, to equal property and advantages through life, is as gross a fraud, as glaring an imposition on the credulity of the people, as ever was practiced by monks, by Druids, by Brahmins, by priests of the immortal Lama, or by the self-styled philosophers of the French revolution. For honor's sake, Mr. Taylor, for truth and virtue's sake, let American philosophers and politicians despise it."—(Vol. vi. p. 454.)

LI^BERTY, a co. in n. Florida, having for its w. border the navigable Appalachicola river, and its e. the Ocklockonkee river, is bounded on the extreme n. by the Jacksonville, Pensacola and Mobile railroad; 800 sq.m.; pop. '80, 1362—1361 of American birth, 548 colored. Its surface is even, it has good tillable lands, and fine grazing pastures, but its farms are scattered and it is four-fifths woodland. Its soil produces tobacco, cotton, wool, rice, oats, corn, sweet potatoes, dairy products, and sugar-cane. It produced in '70, 16,335 lbs. of honey. Seat of justice, Bristol.

LI^BERTY, a co. in s.e. Georgia, having the Cannouchee river for its n. boundary, the navigable Altahama river and a tributary for its s.w., and the water of St. Catherine's sound on the s.e.; also drained by the North Newport river; 650 sq.m.; pop. '80, 10,564—10,533 of American birth, 7,040 colored. It is intersected by the Savannah, Florida and Western railway. It comprises St. Catherine's island, 15 m. in length, lying within the coast line, the distance that separates it from the mainland being not more than a mile. Its surface is level and sandy, particularly near the rivers, and in certain sections marshy. It is two-thirds covered with pine forests. It has a fertile soil adapted to the raising of live stock, oats, corn, sugar-cane, cotton, wool, sweet potatoes, wine, dairy products, honey, and in '70 it produced 1,219,430 lbs. of rice. Cash value of farms in '70, \$684,656, numbering 2,082 farms. Seat of justice, Walthourville.

LI^BERTY, a co. in s.e. Texas, traversed by Trinity river and the Texas and New Orleans railroad; 1600 sq.m.; pop. '70, 4,414. Its surface is partly in prairie and partly in timber. Mineral springs are numerous, and petroleum has been found in some places. Cotton is one of the chief products of the soil, and cattle-raising is extensively pursued. Capital, Liberty.

LI^BERTY, the capital of Clay co., Mo., on the Hannibal and St. Joseph railroad, 16 m. s. of Holt; pop. 1700. It has two weekly newspapers and is the seat of considerable trade.

LI^BERTY, in theology. See FREE WILL, *ante*.

LI^BERTY OF THE PRESS. See PRESS, LIBERTY OF; LIBEL.

LI^BERTY, RELIGIOUS, is the natural right, properly belonging to every man, to worship God and form his religious opinions according to the dictates of his own judgment and conscience. God revealed his law to the Hebrews as a nation. His words were spoken to the assembled multitude, demanding obedience from every man. The evi-

dence that it was from him was given publicly to them all. Thus declared and proved it was binding on them; but the question whether they would receive it was between them and God. The adoption of it was to be their own voluntary act. After their entrance into Canaan the subject was submitted to them in a public assembly. All civil authority over religious affairs being disclaimed, the right of every man to judge and act for himself concerning them was recognized; the civil magistrate having simply the same right as every other man. This right the people exercised and thus entered into a covenant with God, by virtue of which the law revealed by him and adopted by them became the religion of the land. Under the old monarchies the king, arrogating to himself absolute power over his subjects, made no distinction between religious and secular things. Religion was simply one department of his government, in which his will was the only law. Thus the kings of Assyria, Babylon, Persia, and Syria imposed religion by absolute decree on all the nations under their control. Thus the Roman empire made laws on the subject of religion as a part of state affairs. When Christianity began to spread through the empire the emperors regarded it as subject to their will, because developed within their territory. Generally they were hostile to it and for various reasons. As it increased in power they became jealous of it. They strove to crush it as something that rivaled and threatened to subvert their own authority. This state of things, continuing for 300 years, culminated in Diocletian's determined effort to exterminate Christianity, in which he boasted for a time that he had succeeded. When Constantine, having become emperor by success in war, embraced Christianity, the hostility ceased; but the exercise of authority over the whole church went on unchanged, except that, being now in the hands of a friend and joyfully recognized by bishops and churches as belonging to him, it was extended to all departments of religious affairs. The first general council was convened by him, and was formally opened by his stately entrance, which Eusebius thus describes: "After all the bishops had entered the central building of the royal palace each silently awaited the arrival of the emperor. When his approach was announced they all rose from their seats, and the emperor appeared, like a heavenly messenger of God, covered with gold and gems—a glorious presence, very tall and full of beauty, strength, and majesty. When he reached the golden throne prepared for him he stopped, and sat not down until the bishops gave him the sign. And after him they all resumed their seats." In process of time, after the removal of the government from Rome, much of the authority over the west which the emperor had exercised naturally fell to the bishop of Rome, or was adroitly secured by him. Thus, as the papacy was established and strengthened, the governments of Europe found themselves subjected to an absolute dominion under the name of ecclesiastical authority. At the reformation, when several states of Europe renounced the authority of the pope, the Protestant kings assumed the headship of the church as a department of the government belonging to them without question, by virtue of their office. The assumed power of legislative control embraced the very existence and organization of the church as a part of the state, and included its creed, ministers, services, and laws. Thus a national church being established in each country, they who differed from it in religious opinion or practice were liable to coercion, loss of property, civil disabilities, imprisonment, and even death. This state of things was one of the chief forces that produced and molded the settlement of those British colonies in America which at length became the United States. But, although many of the colonists came to these shores in order to enjoy religious liberty for themselves, none of them at first had learned to regard religion as separate from the state. On the contrary, the best of them expected to establish a religious state. In some colonies particular forms of religion were set up, and some articles of faith were established. In South Carolina, New York, and Virginia the church of England was established by law. In New England a kind of theocratic government was attempted. Among these colonies violent efforts were made to enforce uniformity. To Maryland, under the guidance of a governor who was a Roman Catholic, belongs the honor of granting toleration to other forms of religion. Rhode Island has the still higher distinction of being the first state that, separating entirely civil government and religion, recognized in its constitution the right of every man to absolute religious liberty. This separation of religion from secular affairs, having been once perceived and acknowledged, was rapidly accepted in the colonies, so that when the constitution of the United States was formed these two articles were made parts of it: "No religious test shall ever be required as a qualification to any office or public trust under the United States." "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." The constitutions of the several states contain similar provisions. It has become a settled American principle, whether rightly or wrongly, that religion, from its very character, is a separate thing from civil governments; and that, as to it, all persons are equal and free before the law. The influence of American principles and practice has been very powerful over Europe and other parts of the world. Toleration in religious matters is becoming general, and great progress towards liberty of worship has been made. In France, different denominations are aided by the government; in Germany, the imperial government interferes little with the right of worship; in Russia, the public opinion of Christendom in general and of the United States in particular has mitigated the severity of autocratic control over religious affairs; Spain and Italy have been revolutionized; and under the Vatican liberty of worship is enjoyed. The liberty

of belief and worship, however, is not held to include the right to form organizations called religious which hold themselves not amenable to the civil government. The colonies of Great Britain possess perfect religious liberty. A large part of the Scottish church has voluntarily renounced all governmental endowments in order to be free from state control. The Anglican church in Ireland has been disestablished by law. It is still established in England, but a particular religious belief is not now required as a qualification for any civil position, except the throne and the head-ship of a few literary institutions. In the Turkish empire, under the influence of American instruction and European diplomacy, much progress towards religious liberty has been made. And in most other countries of the world, through the power of civilization, commerce, and philanthropy, liberty is either positively or tacitly given to practice, teach, and embrace the Christian faith. In Austria, while there is a relaxation of former restraint, religious liberty cannot be said to be fully exercised; there are instances even of persecution.

LIBERTY OF THE SUBJECT is a general phrase descriptive of the right of the individual subject to do all things not specially prohibited by the law, and the less restriction there is by the law, the greater is the extent of the liberty enjoyed. In its widest sense, the phrase may be understood as comprising the whole of the rights allowed by law to the subject; but what is generally understood is the liberty of the person, or of rights connected with the person—such as personal liberty or freedom from slavery, the right of free speech, liberty of conscience, liberty of the press, and constitutional liberty, or the liberty to influence and take part in legislation, which may be further subdivided into the limitation of the royal prerogative, the powers and privileges of parliament, the right of applying to courts of law for redress of injuries, the right of petitioning the crown or parliament, the right of having arms for defense, the right of habeas corpus, etc. All these subjects are noticed in detail under their proper heads.

LIBIDIBI. See DIVIDIVI.

LIBOCEDRUS, a genus of evergreen trees, belonging to the conifera, resembling the *arbor vitæ*, but differing in the structure of the cones, the scales not overlapping as in that tree. There are two species in New Zealand, two in the mountains of Chili and in the Pacific sierras of the United States, growing usually at an elevation above 4,000 ft. The last-named species was named by Dr. John Torrey *L. decurrens*, from the fact that the bases of the small scale-like leaves are decurrent upon the stem. The tree attains a height of from 120 to 140 ft., and a trunk from 6 to 8 ft. in diameter without branches for 80 to 100 ft. Its beautiful, glossy, green foliage, and its graceful form when young make it one of the finest of ornamental evergreens. Some have been planted in the vicinity of New York and are said to have thrived well. It has been confounded with the *thuja gigantea*, but its decurrent leaves make an easy distinction. In California it is called *white cedar*, but this name properly belongs to another tree. Its wood, of a yellowish color, surpasses red wood in durability, and is valuable for various purposes.

LIBOURNE, a handsome t. of France, in the department of Gironde, on the right bank of the Dordogne, at its confluence with the Isle, 20 m. n.e. of Bordeaux. It is one of the ancient *Bastides* or free towns, and was founded by Edward I., king of England, in 1286. It carries on considerable trade in wines, spirits, grain, salt, and timber. Cotton-yarn, iron, leather, ropes, and nails are manufactured. Pop. '72, 11,456.

LIBRA, the seventh sign in the zodiac. At the first point of Libra, the ecliptic passes across the equator to the southern hemisphere, this point being thus the *autumnal equinox*.

LIBRARIES. The term library is applied indifferently to buildings, etc., destined to contain books, and to the books themselves deposited in these buildings. In the present article, it is used chiefly, if not exclusively, in the latter sense.

Passing over the "libraries of clay," as the collections of inscribed bricks and tiles of the Assyrians and Babylonians have been aptly designated, the first library, properly so called, of which we have any knowledge, is that which, according to Diodorus Siculus, was formed by the Egyptian king Osymandyas. The existence of this establishment, with its appropriate inscription, *Psyches iatreion*—the storehouse of medicine for the mind—was long regarded as fabulous; but the researches of Champollion, Wilkinson, and other modern investigators, go far to prove that the account of Diodorus, though perhaps exaggerated, is at least based upon truth. A more celebrated Egyptian library was that founded at Alexandria by Ptolemy Soter, for an account of which see ALEXANDRIAN LIBRARY. The library of Pergamus, a formidable rival to that of Alexandria, was founded probably by Attalus I., and was largely increased by the fostering care of his successors. As stated in the article just referred to, it was ultimately removed to Alexandria, being sent by Antony as a gift to Cleopatra. At the time that this transference took place, it contained, according to Plutarch, 200,000 volumes.

The first public library established at Athens is said to have been founded by Pisistratus; but the information we possess regarding this and other Grecian libraries is meager and unsatisfactory. The earliest Roman libraries were those collected by Lucullus and by Asinius Pollio. The latter was a public library, in the fullest sense; and the former, though private property, was administered with so much liberality as to place it nearly on the same footing. Various other libraries were founded at Rome by Augus-

tus and his successors; the most important, perhaps, being the Ulpian library of the emperor Trajan. The private collections of Emilius Paulus, Sulla, Lucullus (already mentioned), and Cicero, are well known to every student of the classics.

The downfall first of the western, and subsequently of the eastern empire, involved the destruction or dispersion of these ancient libraries. The warlike hordes by whom these once mighty monarchies were overthrown had neither time nor inclination for the cultivation of letters; but even in the darkest of the dark ages, the lamp of learning continued to shine, if with a feeble, yet still with a steady light. Within the sheltering walls of the monasteries, the books which had escaped destruction, the salvage, if we may so express it, of the general wreck, found a safe asylum; and not only were they carefully preserved, but so multiplied by the industry of the transcriber, as to be placed beyond all risk of loss for the future. Amongst the conventional libraries of the middle ages specially worthy of notice are those of Christ church, and of the monastery of St. Augustine, Canterbury; of the abbeys of Fleury and Clugni, in France; of Monte Cassino, in Italy; and of St. Gall, in Switzerland. Private collectors, too, existed then as now, though, of course, their number was small. Amongst these, Richard de Bury, bishop of Durham, holds a distinguished place.

The revival of learning in the 14th and 15th centuries, followed immediately by the invention of the art of printing, led naturally to a vast increase in the production of books, and introduced a new era in the history of public libraries. The number of these establishments which have since sprung into existence is immense, and is constantly increasing; so much so that a bare list of them would far exceed the limits of an article like the present. All, therefore, that we propose to do is to give a short account of the most important and interesting amongst them.

First among the libraries of Great Britain, and second to few, if to any abroad, is that of the British museum. For an account of this magnificent collection, see BRITISH MUSEUM. Next in rank is the Bodleian library at Oxford, which has also been already described. See BODLEYAN or BODLEIAN LIBRARY. The third and fourth places are occupied by the public, or university, library of Cambridge, and the library of the faculty of advocates at Edinburgh, which are nearly on a par as regards extent and value. A more particular notice of the latter will be found under the heading ADVOCATES' LIBRARY; the number of volumes which it contains at present may be stated as not less than 250,000. The library of Trinity college, Dublin, with about 170,000 vols., is the largest and most valuable in Ireland. These five libraries have long been, and still are, entitled by statute to a copy of every book published in the empire; the act of parliament by which the privilege is at present regulated is the 5 and 6 Vict. c. 45. Besides the above, six other libraries had been in the enjoyment of the same privilege up to the year 1836. By the act 6 and 7 Will. IV. c. 110, which was then passed, the number was reduced from eleven to five; compensation for the loss of the privilege being allowed, in the form of an annual grant of money charged on the consolidated fund. The amount of this grant was, in each case, determined by a computation of the average annual value of the books received during the three years immediately preceding the passing of the act. The names of the libraries referred to, with the number of volumes they at present contain, and the annual sum received in lieu of the privilege, are as follows:

Edinburgh University.....	130,000	£575
Glasgow " 	100,000	707
St. Andrews " 	70,000	630
Aberdeen " 	50,000*	320
King's Inn's, Dublin,.....	60,000	433
Sion College, London,.....	55,000	363

The minor libraries of Great Britain are so numerous that a mere list of their names would exceed the limits within which an article like the present must be confined. Amongst those deserving special notice are the library of the society of writers to the signet, Edinburgh, containing upwards of 55,000 vols.; the Hunterian library, Glasgow, with about 13,000 vols., including many choice specimens of early printing; the Chetham library, Manchester, upwards of 18,000 vols.; Dr. Williams's library, Red Cross street, London, with more than 20,000 vols., freely opened to the public; the archiepiscopal library at Lambeth, containing at least 27,000 vols.; Marsh's library, Dublin, with about 18,000 vols.; the library of the Dublin royal society; and the libraries belonging to the different colleges at Oxford and Cambridge, some of which are of considerable extent and value. The public libraries' acts have been adopted by several of the large towns in Britain—Manchester, Birmingham, Liverpool, and Glasgow being the most important. The free libraries established in these places under the provisions of the acts just named are in a flourishing condition. Of private libraries in England, it will be sufficient to name that of earl Spencer, at Althorp, containing upwards of 50,000 vols., many of extreme rarity and value, and all in admirable condition.

The great national library of France, la bibliothèque du roi as it used to be called, la bibliothèque nationale as it is called at present, is one of the largest and most val-

* About three-fourths of these are lodged in King's college, and the remainder in Marischal college.

able collections of books and manuscripts in the world. Attempts to form a library had been made by Louis XI. and his successors with considerable success; but the appointment of De Thou to the office of chief librarian by Henry IV. may be regarded as the foundation of the establishment as it now exists. The number of printed volumes contained in it is estimated at nearly 1,500,000, and of manuscripts at about 150,000. Amongst libraries of the second class in Paris, the arsenal library with 300,000 vols., the library of Ste. Geneviève with 200,000, and the Mazarine library with 160,000, are the chief. Many excellent libraries are to be found in the provincial towns of France, particularly at Rouen, Bordeaux, and Lyons.

Italy is rich in important libraries, amongst which that of the Vatican at Rome stands pre-eminent. The number of printed volumes is only about 100,000; but in the manuscript department the number amounts to no less than 25,000, the finest collection in the world. The Casanata library, also at Rome, is said to contain upwards of 120,000 vols. The Ambrosian library, at Milan, has a collection of nearly 140,000 vols.; and the Brera library, of the same city, one of about 180,000. At Florence we find the Laurentian library, consisting almost entirely of manuscripts; and the Magliabechi library, with about 200,000 vols. Amongst the other libraries of Italy worthy of notice are the royal library at Naples, with 200,000 vols., and that of St. Mark at Venice, with 120,000, and 10,000 manuscripts.

The principal libraries of Spain are the biblioteca nacional at Madrid, numbering nearly 230,000 vols., and the library of the Escorial, which has been already noticed. See ESCURIAL.—Of the libraries of Portugal, no trustworthy statistics can be obtained.

The imperial library at Vienna, founded by the emperor Frederick III., in the year 1440, is a noble collection of not fewer than 400,000 vols.; of which 15,000 are of the class called incunabula, or books printed before the year 1500. The royal library at Munich owes its origin to Albert V., duke of Bavaria, about the middle of the 16th century. The number of volumes is estimated at 900,000, including 13,000 incunabula, and 22,000 manuscripts. It is worthily lodged in the splendid building erected by the late king, Ludwig I., in the Ludwig strasse. The royal library at Dresden is a collection of about 500,000 vols., amongst which are included some of the rarest specimens of early printing, amongst others the Mainz Psalter of 1457, the first book printed with a date. The foundation of the royal library at Berlin dates from about the year 1650. It now extends to about 700,000 vols. of printed books and 15,000 vols. of manuscripts, including amongst the latter many precious relics of Luther and the other leaders of the reformation. Of the other libraries of Germany, it will perhaps be enough to notice that of the university of Göttingen, with upwards of 500,000 vols., and the ducal library of Wolfenbüttel, with about 270,000.

In Holland, the principal library is the royal library at the Hague, containing rather more than 110,000 vols., of which about 1500 are good specimens of early printing.

The royal library at Copenhagen was founded about the middle of the 16th century. Its contents are now estimated at nearly 550,000 vols. The university library possesses nearly 200,000 vols., and Classen's library, also in Copenhagen, about 30,000.

In Sweden, the largest library is that of the university of Upsala, consisting of nearly 200,000 vols. One of its chief treasures is the famous manuscript of the Gothic gospels of Ulfilas, commonly known as the Codex Argenteus. The royal library at Stockholm is next in size, numbering upwards of 96,000 vols.

The library of the university of Christiana in Norway, founded in 1811, contains upwards of 200,000 vols.

The imperial library of St. Petersburg was founded about the beginning of the 18th century. In the year 1795 it was largely increased by the addition of the Zaluski library of Warsaw, which was seized and carried off to St. Petersburg by Suvaroff. At present, the total number of volumes is estimated at 900,000, and about 35,000 manuscripts.

In the United States of America, though there are no libraries equaling those of the first rank in Europe, there are still a few of considerable magnitude and value. The oldest and one of the largest among them is that of Harvard college, Cambridge, Mass., which has been in existence for more than 200 years; and contains about 200,000 volumes. Libraries are also attached to the other collegiate institutions of the country. The Astor library, New York, named after its liberal founder, was opened in 1854 with a collection of about 80,000 volumes, since increased to upwards of 150,000. It is in the fullest sense a free public library. The library of congress, the only library supported by government, to which a copy of every copyright book must be sent, is naturally the largest in the states, numbering about 270,000 volumes and 45,000 pamphlets. The Smithsonian institution at Washington embraces in its plan the formation of an extensive library. But little progress has been made in carrying out this part of the scheme. The proprietary libraries are numerous, and several of them are of considerable extent: that of Philadelphia, in the foundation of which Franklin was largely concerned, numbers upwards of 100,000 volumes; and that of the Boston atheneum, founded in 1806, has 103,000. The Boston public library has, in 20 years, become the second largest, and perhaps the most widely useful library in the states; it now numbers 260,000 volumes. The New York mercantile library possesses 150,000 volumes.

An important conference of librarians was held in London in 1877: see its *Transactions and Proceedings* (Lond. 1878).

LIBRARIES (ante). The first library foundation in America was established in 1621 through a benefaction, on the part of an unknown person in London, to the Henrico college, organized by the colonists of Jamestown, Va. The gift comprised "a small Bible, with a cover richly wrought; a great church Bible; the Booke of Common Prayer; . . . S. Augustine *De Civitate Dei*; Master Perkins, his workes; and an exact map of America." Other volumes were presented by persons in England and in the colonies; but on Mar. 22, 1622, the settlements on the James were swept away by the torch and tomahawk of the savage, and the library ceased to exist. The next attempt at the formation of a library occurred in Cambridge, Mass., in the case of the Harvard college endowment in 1638. This collection increased slowly during the next century and a quarter, and in 1764 numbered about 5,000 volumes. On Jan. 24 of that year it was totally destroyed by fire. In the meantime there had been formed in Philadelphia the nucleus of the institution which has existed to the present day, and is now known under the name of the "Philadelphia library company." It grew originally out of a debating society, of which Benjamin Franklin was one of the founders, and which he terms "the mother of all the North American subscription libraries." This society was made up of reading men, who turned their own books into a common stock; and, as opportunity offered, purchased others, importing the latter from London, and had a number presented to them. This beginning of what was to become one of the great libraries of the western world was in 1729-30. Ten years later the books were removed to a room in the state-house; in 1773 they were again transferred, this time to Carpenters' hall. In 1742 the company was regularly incorporated; and in 1769 and 1771, the Union library company, the Association library company, and the Amicable company were merged with it, the entire corporation assuming the name which it has ever since borne. The first building erected in the United States to be devoted to the uses of a public library was that of the Loganian library (1745-50), which was the gift of James Logan to the city of Philadelphia, and stood in Sixth street, between Chestnut and Walnut streets. The Loganian library passed, in 1792, under the control of the Philadelphia library company. The New York society library (New York, 1700), the Redwood library (Newport, R. I., 1747), and the Providence library (Providence, R. I., 1753), were among the principal libraries founded in the colonies before the revolution. In 1765 a circulating library was established in Boston, Mass., by one John Mein, a bookseller, which numbered about 1200 volumes, had a printed catalogue, and was supported by an annual subscription of 28s. from each member. The will of John Oxenbridge of Boston, dated Jan. 12, 1673-4, makes mention of a bequest of books to the "public library;" and reference to such an institution also occurs in the town records for Mar. 11, 1695; no other information is afforded concerning it.

The introduction of the system of school libraries originated in the state of New York in 1835, when a law was passed appropriating \$55,000 a year for the purchase of books for the different school districts, and requiring an equal amount to be raised by taxation to be added to that sum and applied to the same purpose. The plan continued in successful operation until 1853, when these libraries contained an aggregate of 1,604,210 volumes. From that period it was not sustained; the number of volumes decreased, and had fallen off one-third in 1875; and the usefulness of the institution was apparently over. In Massachusetts the school library system went into effect in 1837, but existed only about twelve years, when they were superseded by free town libraries. In some of the states which appropriated sums for the foundation and sustenance of district school libraries, they flourished from the first, and have continued to answer their purpose satisfactorily up to the present time. Such has been the case in California, Iowa, Illinois, and New Jersey. In other states, as in New York, they were popular and well-conducted for some years, but gradually fell into a decline, out of which they were gradually brought again to a healthy condition; as in Connecticut, Rhode Island, Indiana, Ohio, and Wisconsin. In the states of Maine, Missouri, Oregon, Pennsylvania, Kansas, Virginia, Kentucky, Minnesota, and others, the effort to establish these libraries has not met with success; although in most instances supported by special legislation in its favor.

Mercantile libraries started with those of Boston, Mar. 11, 1820, and New York, Nov. 9, 1820, which were followed rapidly by similar organizations in other states. Such institutions have been usually founded by merchants' clerks, on a basis of annual dues and fees on entrance. They have not generally been self-supporting on this foundation, but have owed whatever prosperity they have achieved to liberal gifts from individuals. Young men's Christian associations, though covering a broader field, include a public library system in their scheme of work. The first of these associations in America was established in Boston in 1851, the idea having originated in London in 1844. Their number in the United States and Canada had reached 519 in 1875. Of these, 198 owned libraries containing 181,340 volumes. There were also 47 women's Christian associations, with 16 libraries under their control.—Of the college libraries reported in 1876, 71 were considered important, containing, in the aggregate, 1,392,819 volumes. The number of prominent theological libraries was 44, reporting 524,024 volumes. Fifty principal law libraries, not including those of the general government, numbered 254,403 volumes; 30 medical libraries contained 166,755 volumes; 80 scientific libraries, 430,507 volumes; and 45 prisons and reformatories, 64,144 volumes. The total

number of public libraries in the United States in 1876 was 3,647, containing 12,276,964 volumes. As the average increase was about 1,000,000 volumes per year, the number in 1881 would probably be about 16,000,000; to which add the number in the district school libraries, not enumerated above, viz., 1,365,407, and the grand total would be nearly 18,000,000 volumes.

The leading public libraries of the country in size and importance are the Astor library (q.v.), New York; Atheneum, Boston; library of congress, Washington; Lenox, New York; Philadelphia library company, Philadelphia; public, Boston; and society, New York. The Boston atheneum originated in 1805 in the anthology society, and was at first a reading-room. In 1807 it was incorporated and received its present designation; and seven years later it contained 8,209 volumes. The circulation of its books among proprietors began to be permitted in 1827, when it contained about 20,000 volumes. The present edifice of this institution was erected, and opened for use in 1849, and cost \$200,000. The library contained 105,000 volumes in 1876.—The library of congress was founded on the establishment of the seat of government in Washington in 1800, and at the session in Dec., 1801, Thomas Jefferson, who presided, took a warm and practical interest in the progress of the library. At this session, also, John Randolph, of a special committee, made a report which formed the basis of an act of congress, the first of that nature, organizing the library. On Aug. 25, 1814, the capitol was burned by the British, and the library, which contained about 3,000 volumes, was entirely destroyed. During the same year congress purchased the private library of ex-president Jefferson, numbering about 6,700 volumes, for \$23,950. An annual appropriation being made for the purchase of books, the library continued to grow slowly, and in 1851 numbered 55,000 volumes. On Dec. 24 of that year, a second conflagration destroyed all but 20,000 volumes, which fortunately formed the more valuable portion, but from that period the library continued to increase more rapidly than ever before. In 1866 the collection of books of the Smithsonian institution was transferred to the shelves of the library of congress, an increase of 40,000 volumes. In the following year it was still further enriched through the purchase by congress of the historical library left by Peter Force, of Washington, at a cost of \$100,000, and which numbered nearly 60,000 titles in books, pamphlets, and manuscripts, besides the unpublished materials of the *Documentary History of the United States*, of which Mr. Force had issued nine folio volumes. The act of congress, passed Aug. 10, 1846, made it incumbent on the author of every book, map, print, etc., for which a copyright was secured, to forward, within three months after publication, one copy each to the librarians of the Smithsonian institution and congressional library for the use of these libraries. The average number of deposits under this act amount to 25,000 articles per annum. In 1861 the annual appropriation for the purchase of books was increased by congress from \$7,000 to \$10,000. The library of congress contained, in 1876, 300,000 volumes and about 60,000 pamphlets.—The Lenox library, New York city, was incorporated in 1870, and was the gift to the city of James Lenox, esq., a wealthy gentleman of recognized bibliographical attainments, and whose private collection, numbering about 15,000 volumes, was exceptionally rich in the department of editions of the Scriptures and that of American history. Mr. Lenox's gift included the handsome and commodious library building, with the land on which it was erected; the rare collection of books above mentioned; and a considerable gallery of ancient and modern paintings. The entire sum of money represented in this library is doubtless considerably more than \$1,000,000. Of this sum, \$212,000 was invested as a permanent fund for the sustenance of the library and its future increase.—The Philadelphia library remained in Carpenters' hall until 1790, when it was removed to a building in Fifth street; and thence, in 1880, to its present quarters, corner Thirteenth and Locust streets, Philadelphia. Including the Loganian library, it numbered in 1876 about 100,000 volumes. The present building was constructed by subscription, to which the late Joseph Fisher gave by bequest the sum of \$54,488.12. In 1869 Dr. James Rush bequeathed his large estate, valued at over \$1,000,000, for the purpose of erecting a fire-proof building, to be called the Ridgway branch of the Philadelphia library; and this structure of granite was erected at the corner of Broad and Christian streets, and devoted to the purposes for which it was designed.—The Boston public library was founded by act of legislature passed in 1848; and was organized in 1852, with Edward Everett as first president. Money and books had already been given to the institution by prominent citizens, and in the same year (1852) Mr. Joshua Bates of London presented to it the sum of \$50,000. The library was opened to the public, Mar. 20, 1854, in a building applied to the purpose, in Mason street; and in 1858 the building erected for its permanent home was opened, both as a reading-room and circulating library. The reference library (Bates's hall) was opened in 1861 with about 74,000 volumes. The whole number of books in the library in 1876 was about 300,000 volumes.—The New York society library was founded in 1700 under lord Bellomont, governor of the province, being then known as the city or public library, and contained in the city hall. It was probably the earliest loan library established in America, and became particularly valuable through being enriched by the gift of the collection of rev. Dr. Millington, of Newington, England, presented to the colonies of America, and deposited in the city hall of New York, by the society for the propagation of the gospel; this collection numbered 1642 volumes. In 1754 the society

library proper was formed on a basis of membership subscription, and the first purchase of books, made in London, was deposited with the Millington collection. This library contained in all, in 1776, about 4,000 volumes. It continued in the city hall until 1795, when a building was erected for its use in Nassau street. In 1840 a new building was put up on Broadway (corner Leonard street), in which the library was placed, and where it remained until 1853, when the property was sold and the books removed to the Bible house. The final transfer to the present society library building in University place was made in 1856. In 1876 the number of books in the society library was about 65,000.—All the large American cities are supplied with public libraries of varying degrees of completeness and efficiency. The public library of Cincinnati, Ohio, originated from a concentration of the school libraries of that city; and occupied its present building, constructed for the purpose, in 1874, at which time it contained 70,000 volumes, with capacity for 250,000. Its actual date of foundation is Mar. 18, 1867, when a state law organized it on its present basis. The mercantile library association of St. Louis, Mo., are in possession of the largest public library in that city, numbering in 1876, 42,013 volumes. It was founded in 1846. The principal public library of Baltimore, Md., is that of the Peabody institute, founded in 1857, and opened to use in 1861, and which contained, in 1875, 57,458 volumes. The San Francisco mercantile library, the leading one in that city, was founded in 1853, and in 1876 contained 41,573 volumes. The Brooklyn, N.Y., mercantile library was founded in 1857 and contained 50,257 volumes in 1875. In the same city the Long Island historical society, founded in 1863, entered its present building in 1880. In 1876 it contained 26,000 bound volumes and 25,000 pamphlets, besides valuable manuscripts, paintings, and curiosities. The library of the Chicago historical society and the young men's association library were both destroyed in the great fires of 1871 and '74, but the former has since been slowly recuperating. The public library of that city resulted from the general public sympathy felt on account of these losses, and originated in generous donations on the part of authors and others, at home and abroad. This library numbered nearly 50,000 volumes in 1876.—The libraries of the different departments of the general government at Washington numbered, in 1876, 656,070 volumes and 116,505 pamphlets. The state and territorial libraries, 47 in number, comprised in the same year 834,219 volumes. The number of historical societies in the United States was 77, and their libraries included 482,035 volumes, exclusive of a very large number of valuable pamphlets. The number of mercantile libraries, young men's associations, and atheneums reported was 64, numbering 1,055,903 volumes.—Not to enter at any length on the nature of the management of public libraries in the United States, it may be remarked that in recent years there has been exhibited a more general tendency towards the classification of books by subjects, and in the direction of the system of card-cataloguing. These have taken the place of the ancient method of alphabetical arrangement by authors, and the manuscript, or printed catalogue. Even in comparatively small collections the author system of arrangement has been found inadequate when followed exclusively; while the elasticity of the card-catalogue, whether of authors or subjects, has approved itself fully, in the minds of thoughtful librarians, as a simplification of their duties in this regard, while avoiding many inconveniences and difficulties which prove insuperable in the application of other methods. Adopted in connection with an occasional printed catalogue, this is found to answer to the wants both of those who desire general information as to the contents of a library, and those who wish to keep pace with its most recent acquisitions.

LIBRARIES' ACTS. Though there is no systematic provision of libraries for public use at the expense of the state, except the British museum library in London, an attempt has been made by the legislature of late years to empower districts to establish libraries, and to tax the inhabitants for that purpose. The first act, 13 and 14 Vict. c. 65, passed in 1850 for England, has been repealed by subsequent amended and extended acts, the last of which is 29 and 30 Vict. c. 114, in 1866. It is applicable to any burgh, district, or parish, whatever the amount of the population; a meeting of the rate-payers may be obtained by the requisition of ten of their number addressed to the town-council, or other local board; and the adoption of the act is decided by a simple majority of those present at the meeting. The rate to be levied in all such cases is not to exceed 1d. in the pound. All such libraries are to be open to the public free of all charge. A similar act extended the first English act to Ireland and Scotland; but by amended acts, passed in 1867 and 1871, Scotland has been placed on a similar footing to England for the adoption of the act.

LIBRARIES, MILITARY, are either garrison or regimental. The former comprise large collections of books, with newspapers, games, lectures, etc., in commodious rooms, and are intended to win soldiers from the gin-shops and vicious haunts which are ever prevalent in garrison towns. Attempts have been made to provide the soldiers with books, both for instruction and amusement; but statistics prove that the men patronize few besides fiction and travels, and religious books not at all. Regimental libraries are smaller collections of books, which accompany regiments in their various movements. The charge for military libraries in the British army was for 1876-77 the sum of £4,085.

LIBRATION (from Lat. *libra*, a balance, meaning a balancing or oscillating motion), a term applied to certain phenomena of the moon's motion. The moon's librations (or, more properly, *apparent librations*) are of three kinds—libration in longitude, latitude, and the diurnal libration. If the moon's rotation in her orbit were uniform, as her rotation on her axis is, we should always see exactly the same portion of her surface, but as this is not the case, there are two small strips of surface running from pole to pole, on the e. and w. sides, which become alternately visible; this is called the moon's *longitudinal libration*. The *libration in latitude* arises from the moon's axis not being perpendicular to her orbit, in consequence of which a portion of her surface round the north pole is visible during one-half, and a corresponding portion round the south pole during the other half of her revolution in her orbit. The *diurnal libration* hardly deserves the name, and is simply a consequence of the observer's position on the surface of the earth, and not at the center: it consists in the gradual disappearance of certain points on one edge of the moon's disk as she approaches her culmination, and the appearance of new points on her opposite border as she descends. The first and third of these librations were discovered by Galileo, and the second by Hevelius.

LIBRI-CARRUCCI, GUILLAUME BRUTUS ICILIUS TIMOLEON, Count, French mathematician and bibliographer, son of an Italian refugee, who was condemned at Lyons in 1816 for forgery, was b. at Florence Jan. 2, 1803. Having early devoted himself to the study of mathematics, he became professor in the university of Pisa, where he contributed to the transactions of scientific societies a number of remarkable papers on *The Theory of Numbers* (1820); *Some Points of Analysis* (1823); *The General Resolution of Indeterminate Equations of the First Degree* (1826); etc.

After 1830, having been compromised in the political movements, he was obliged to leave Tuscany, and went to France as refugee. He there found a patron in Arago (whom he afterwards attacked in the most spiteful manner); was naturalized, and in a short time elected member of the academy of sciences, professor of analytics at the Sorbonne, chief inspector of public instruction, and superintendent of the state libraries. He was decorated with the legion of honor, and appointed editor of the *Journal des Savants*, etc. Libri-Carrucci's works at this period are varied and numerous. In particular may be mentioned his *History of Mathematical Science in Italy from the Renaissance to the End of the 17th Century* (1838-41, 4 vols. 8vo), in which he displayed much acuteness and erudition. He was besides a most determined bibliomaniac, and found means of collecting a library for himself which contained such a rich stock of *incunabula* of all kinds, and of the greatest typographical curiosities, that several public sales, which he got up for his own benefit and of which each realized from £4,000 to £5,000, did not in the least degree diminish his collection. In consequence of the remarkable phenomenon of a library remaining complete in spite of repeated sales, Libri-Carrucci began to be suspected of making use of his special position to abstract books and valuable MSS. from the public libraries. A report had even been secretly prepared on the subject by the public procurator, and communicated to M. Guizot to await his decision. The objects abstracted between 1842 and 1847 were approximately valued at £20,000. This document was dated Feb. 4, 1848, and was found in the foreign office when the revolution broke out in that month. The case was immediately taken up by the courts, and after a long and careful examination, the accused, who, in the meantime, had fled to England, was condemned June, 1850, to ten years' imprisonment, to degradation, and the loss of his employments. The process created a great sensation, and gave rise to an immense deal of writing for and against the condemned. The most important is an article by P. Merimée, *Le Procès Libri*, in the *Revue des Deux Mondes* (1852), for which the writer was imprisoned, as having, in defense of a "book-stealer," slandered and insulted the French judicature.

Libri-Carrucci continued for two or three years to address letters and pamphlets to persons in France exclaiming against his condemnation in the highest tones of injured innocence. The efforts of M. Merimée in behalf of Libri-Carrucci, and a petition in his favor, addressed to the senate in 1861, only had the effect of bringing out still more damning facts regarding both him and his family. He died Sept. 28, 1869.

LIBUR'NIA, in ancient geography, a mountainous district of Illyricum, on the Adriatic coast, now a part of Croatia and Dalmatia. From early times the Liburni were daring seamen, and were in the possession of Coreyra, Issa, and other islands when the Greeks took these places. They were noted pirates, and their privateers, with a large lateen sail, were for centuries the terror of the seas. The galleys of the Liburni were noted for their light construction and swiftness, and the Romans, adopting this style of naval architecture, called all fast sailing vessels *naves Liburnae*. By means of these light galleys Augustus gained the battle of Actium. The only important towns in Liburnia were Jadera and Scardona.

LIBYA, the name given by the oldest geographers to Africa. In Homer and Hesiod, it denoted the whole of this quarter of the globe, except Egypt; in Herodotus, occasionally, the entire continent; but it is also applied by others in a more restricted sense, to the northern part of the country, from Egypt and the Arabian gulf westward to Mt. Atlas. The great sandy tract, of which the Sahara forms the principal part, was called the

Libyan desert. To what extent it was known to the ancients is not very clearly ascertained. See AFRICA.

LIB'YAN DESERT (*LIBYA, ante*), the name often given by the ancients to the whole of Africa, but generally applied to that part of the Sahara, or Great Desert, lying e. of Fezzān and the country of the Tibboos. The region is probably about 1000 m. long by 500 or 600 m. in breadth. It contains a number of oases, or fertile tracts, islands of verdure in the vast sands, which support a sparse population; but the surface generally consists of irreclaimable sandy or gravelly plains, separated by low rocky ridges, or shelving down in a series of terraces toward the Mediterranean.

LIB'YANS, people of Libya, a name given by the Greeks to Africa, probably from the name of the people whom they found in possession of the northern part of the continent to the w. of Egypt, and who are believed to have been the *Lehabim* or *Lubim* of the Hebrew Scriptures. These Lubim seem to have consisted of wandering tribes, sometimes in alliance with Egypt, at others with the Ethiopians. In the time of Cambyses they formed part of the Persian empire. They are mentioned by the prophet Daniel in connection with the Ethiopians and Cushites. Herodotus divided the natives of Africa into two classes, the Libyans and the Ethiopians, one occupying the northern, the other the southern part. But the Romans limited the term Libya to that part of Africa which extended along the Mediterranean from the Greater Syrtis to Egypt, and stretching inland to the deserts. This was the Libya Proper of the New Testament, Acts ii. 10. Lepsius and other Egyptologists suppose that they occupied even Egypt, until driven out by the Egyptians, who emigrated from Asia. In remote antiquity the people were civilized, and powerful by sea and land. They often invaded Egypt until their power on the sea was broken by Thothmes III., 1600 B.C.; but by land they continued to harass the Egyptians and desolate the country. In 1400 B.C. they joined the Pelasgic nations on the northern coasts of the Mediterranean, and, in connection with the Tyrrhenians and Achaeans, they invaded and nearly conquered lower Egypt, under their king Maurmuin, but they were stopped in central Egypt, and defeated by Rameses II. They were eventually subdued by the Carthaginians, and their country has successfully passed into the hands of the Greeks, Romans, Saracens, and Turks.

LIB'YAN SEA, the name given in ancient geography to that part of the Mediterranean which lies between the island of Crete and the coast of Africa.

LICA'TA. See ALICATA, *ante*.

LICENSE. See GAME, PUBLIC-HOUSES, MARRIAGE, ALIEN.

LICENSE, in law, an authority given by one person or party to another to do certain acts. Licenses are either *executory*, where the act authorized has not been done, or *executed*, where it has been done. At law all licenses may be revoked by the grantor, unless the license be coupled with an interest, and the same rule prevails in equity courts, except that the latter sometimes hold that an executed license, where the licensee has been put to expense, is not revocable at the pleasure of the grantor. Thus, where a licensee who has been granted some privilege in connection with another's land, on the strength of his license has been induced to incur expense, at law his license is still held to be revocable, as a contrary ruling would be equivalent to creating an interest in land without writing, against the provisions of the statute of frauds. A court of equity regards such an executed license as an executed verbal contract, one of the parties to which, the licensee, has gone too far to be put back into his former position as to the other party. But the revocation of an executed license will save the licensee harmless from liability or responsibility for such acts as he has done according to his license. A license is either *express*, i.e., granted expressly, or *implied* from the acts of the grantor. A license in regard to land is not to be confused with an easement which is an indefeasible interest in land, irrespective of the will of the owner of the servient estate, or with a lease which confers a right to the profits of land. An easement, moreover, can be created only by grant or prescription, while a license authorized orally is good. An executed license which puts an end to an easement of the grantor in the licensee's land is irrevocable. The most common licenses in the United States are licenses to sell liquor, to engage in certain occupations, etc. Such licenses are a matter of statutory regulation. A license in international law is an authority given by a state engaged in war to its subjects or the subjects of the state with which it is at war, to engage in a trade forbidden in time of war. The right to give such licenses is original with the sovereign power, and they may be given by commanding officers in the army or navy as its delegates. License in *pleading* is a plea by the defendant in an action of trespass that the owner of the freehold gave his permission to the alleged act of trespass. A license in *patent law* is a permission to make or sell a patented article in a specified locality, or anywhere in the United States.

LICENSE, in music. The liberty which a composer takes in deviating from the rules of his art, and which is often marked with the words *con licenza* in order to indicate that it has been introduced intentionally to produce some unusual effect. Many licenses occur, however, in the works of great composers like Mendelssohn, Bach, and Haydn, where the notice *con licenza* is omitted, but it will generally be found that they

are introduced for artistic purposes, and to strengthen the harmony of some ineffective passage.

LICENTIATE (from Lat. *licet*, it is lawful), one of the four ancient university degrees. It is no longer in use in England, except at Cambridge, which confers the degree of licentiate of medicine. In France and Germany, however, where it is more general, a licentiate is a person who, having undergone the prescribed examination, has received permission to deliver lectures. The degree, as an honor, is intermediate between *bachelor of arts* and *doctor*.

LICENTIATE, among Presbyterians, is a person authorized by a presbytery or similar body to preach, and who thus becomes eligible to a pastoral charge.

LI'CHEN, a papular disease of the skin. There are two species, viz., *L. simplex* and *L. agrius*, the latter of which may be regarded as a very aggravated form of the former. *L. simplex* consists in an eruption of minute papulae of a red color, which never contain a fluid, and are distributed irregularly over the body. They appear first on the face and arms, then extend to the trunk and lower extremities, and are accompanied with a sense of heat, itching, and tingling. In a mild case, the disease is over in a week, but sometimes one crop of papulae succeeds another for many weeks or months. In *L. agrius*, the papulae are more pointed at the summit, and are of a bright-red color, with more or less redness extending round them. In this form of the disease, the general health is usually affected, in consequence of loss of sleep and general irritation.

It is often hard to say what is the cause of lichen. The simpler form is often dependent in children on intestinal irritation, while in other cases it may frequently be traced to exposure to heat, or errors of diet. The severe form is also occasioned by extreme heat and by the abuse of spirituous drinks.

In ordinary cases an antiphlogistic diet, a few gentle aperients, and two or three tepid baths, are all that is required. When the disease assumes a chronic character, a tonic treatment (bark and the mineral acids) is necessary; and in very obstinate cases, small doses (3 to 5 minims, well diluted) of Fowler's arsenical solution may be given with advantage.

LICHENIN is a starch-like body, found in Iceland moss and other lichens, from which it is extracted by digesting the moss in a cold, weak solution of carbonate of soda for some time, and then boiling. By this process the lichenin is dissolved, and on cooling, separates as a colorless jelly. According to Gorup-Besanez (*Lehrbuch der organischen Chemie*, 1860, p. 514), it sometimes assumes a blue, and sometimes a greenish tint, when treated with iodine. In most of its relations it corresponds with ordinary starch.

LICHENS, a natural order of acotyledonous plants, allied to fungi and to algæ. They are *thallogenous*, consisting mainly of a *thallus* (q.v.), and without stem and leaves; wholly cellular, and nourished through their whole surface by the medium in which they live, which is air, and not water, although a certain amount of moisture in the air is always necessary to their active growth; and when the air becomes very dry, they become dormant, ready to resume their growth on the return of more favorable weather. The thallus of some is pulverulent; that of others is crustaceous; of others, leaf-like; of others, fibrous. Reproduction takes place by spores, usually contained in sacs (*asci, theca*), embodied in repositories of various form, often shield-like or disk-like, called *apothecia* (or shields), which arise from the outer layer of the thallus, and are generally very different in color from the thallus. But there is also another mode of propagation by *gonidia*, separated cells of the inner or medullary layer of the thallus, usually spherical or nearly so, and always of a green color. This seems to be a provision for the propagation of lichens, even in circumstances—as of the absence of light—unfavorable to the formation of thecae and spores. Lichens are plants of long life, differing in this very widely from fungi. They are most widely diffused, growing equally in the warmest and the coldest regions. On the utmost limits of vegetation, in very high latitudes, or on the very highest mountains, they cover the soil in great masses. Some grow on earth, others on stones, others on the bark of trees, and some of the tropical species on evergreen leaves. In the great economy of nature they serve for the first commencement of vegetation, especially to prepare the soil for plants of higher organization. The gray, yellow, and brown stains on old walls are produced by minute lichens, which have begun to vegetate where nothing else could. The curiously scattered apothecia of some present the appearance of written characters often seen on the bark of trees. Some hang as tufts or shaggy beards from old trees; some grow amidst heaths and mosses to cover the soil of the most frigid regions. Lichens contain a peculiar gelatinous substance resembling starch, and called *lichenin* or *lichen starch*; generally also a bitter substance called *cetrarine*; resin; a red, bright yellow, or brown coloring-matter; oxalate and phosphate of lime, etc.; and are therefore adapted to purposes of domestic economy, medicine, and the arts. Some are used for food, as Iceland moss (q.v.) and *tripe de roche* (q.v.); some afford food for cattle, as reindeer moss (q.v.); some are medicinal, as Iceland moss; some afford dye-stuffs, as archil (q.v.), cudbear (q.v.), etc.

LICH'FIELD, an ancient episcopal city of Staffordshire, England, a municipal and parliamentary borough and county in itself, is situated 17 m. s.e. of Stafford, and 115 n.w. of London. Its chief edifice is the cathedral, part of which is in the early English style. It has three towers, each surmounted by a spire, and is profuse and elaborate in its ornamentation. The free grammar-school, in which Addison, Ashmole, Johnson, and Garrick were educated, has an income of about £100 a year, and has 9 exhibitions, tenable for 3 years. Considerable brewing is carried on. Pop. '71, 7,347. Lichfield returns one member to parliament.

LICHTENBERG, GEORG CHRISTOPH, 1742-99; b. Ober-Ramstadt, near Darmstadt, taught first by his father mathematics and physical studies; studied at Darmstadt and Göttingen, and appointed professor in the university of Göttingen in 1770. In 1777 was professor of experimental philosophy. He had before this visited Great Britain and made himself master of English literature. In his latter days he was subject to hypochondria, which led him to withdraw from all society other than that of his wife and five children. His malady did not interrupt his studies or his extensive epistolary correspondence. His works were collected in 9 volumes. Among the most important were *Ueber Physiognomik wider die Physiognomen*; *Ueber die Pronunciation der Schöpse des alten Griechenland*. His *Erklärung der Hogarthischen Kupferstiche*, which was unfinished at his death, but published afterwards, was a work of great merit. The author shows keen wit, comic power, and severe satire.

LICHTENFELS, a t. in Greenland, on the s.w. coast, lat. 64° n., long. 52° w., founded by the Moravians, or Bohemian brotherhood, in 1758, and inhabited chiefly by Danes.

LICINIUS, a Roman emperor. See CONSTANTINE I.

LICK, JAMES, 1796-1876; b. Fredericksburg, Lebanon co., Penn.: learned the trade of a pianoforte manufacturer in Philadelphia, and followed the business successively in New York, in Buenos Ayres, Valparaiso, and different places in Peru. In 1847 he settled in San Francisco, bringing with him a capital of \$30,000, which he invested in real estate in that city. The profits on this investment made him very wealthy, and in 1874 he placed \$2,000,000 from his estate in the hands of seven trustees, to be devoted to certain specified public and charitable uses. In 1875 Mr. Lick desired to make some changes in the schedule of his gifts, to which the trustees were doubtful of their right to give assent. At his request they resigned, and other men were selected by him to fill their places. The next year he died, and litigation followed on behalf of his son and other heirs, who advanced a claim upon the property. The issue was settled in 1878 by an agreement on the part of the trustees to pay the son, John H. Lick, \$385,000 in addition to the sum intended for him by his father, he agreeing to divide \$72,000 of the amount between the other heirs. This left the list of Mr. Lick's bequests as follows: To the university of California, for the erection of an observatory, and procuring therefor a telescope superior to and more powerful than any ever before constructed, \$700,000; to the Protestant orphan asylum in San Francisco, \$25,000; to the city of San José, for the purpose of erecting and supporting a non-sectarian orphan asylum, \$25,000; to the ladies' relief and protective association of San Francisco, \$25,000; to the mechanics' institute of San Francisco, for the purchase of scientific and mechanical works, \$10,000; to the San Francisco society for the prevention of cruelty to animals, \$10,000; to found an old ladies' home in San Francisco, \$100,000; for the erection in San Francisco of free public baths, \$150,000; for the erection of a group of bronze statuary around the city hall of San Francisco to represent the history of California, \$100,000; to erect in Golden Gate park a monument to Francis Scott Key, author of *The Star Spangled Banner*, \$60,000; to found and endow the California school of mechanic arts in San Francisco, \$540,000. The residue of the estate, if any there shall be, will be divided between the San Francisco society of pioneers and the academy of sciences. How many of the associations named above have received in whole or in part the sums awarded them is not reported authoritatively. Of course, considerable time was required to turn the estate into cash and close the various trusts; but it is believed that sooner or later Mr. Lick's plan of beneficence will be completely executed. The observatory of the university of California will be erected on the summit of Mount Hamilton, a peak of trap-rock in Santa Clara co., 4,250 ft. above the sea, where there is nothing to obstruct the view within a radius of 100 miles. The point is nearer to the equator than any of the grand observatories of Europe or America.

LICKING, a co. in central Ohio, drained by Licking river and its branches; 670 sq. m.; pop. '80, 40,451. The surface is level or rolling, and the soil rich and well cultivated. Its products are various and extensive, live stock, grain, and wool being the principal. The chief manufactures are carriages, leather, lumber, and saddlery. The Ohio canal, and the Sandusky, Mansfield, and Newark, and the Pittsburg, Cincinnati, and St. Louis railroads pass through the county. Capital, Newark.

LICKING RIVER rises in the mountains of Floyd co., Ky., flows n.w. 180 m. and empties into the Ohio opposite Cincinnati. At high water small steamboats can ascend

a distance of 60 m. to Falmouth. Another river of the same name, near the center of Ohio, empties into the Muskingum opposite Zanesville.

LICORICE (*glycyrrhiza*), a genus of perennial herbaceous plants of the natural order *leguminosæ*, sub-order *papilionaceæ*; having long, pliant, sweet roots, and generally creeping root-stocks; pinnate leaves of many leaflets, and terminating in an odd one; flowers in spikes, racemes, or heads; a 5-cleft, 2-lipped calyx, and a 2-leaved keel. The ancient Greek name, now the botanical name, signifies *sweet root*, and from it, by corruption, licorice and other modern names are derived. The roots of licorice depend for their valuable properties on a substance called *glycyrrhizine*, allied to sugar, yellow, transparent, uncryallizable, soluble both in water and alcohol, and forming compounds both with acids and bases. They are a well-known article of *materia medica*, and were used by the ancients as in modern times, being emollient, demulcent, very useful in catarrh and irritations of the mucous membrane.—The roots of the COMMON LICORICE (*G. glabra*) are chiefly in use in Europe. The plant has stems 3 to 4 ft. high, and racemes of whitish violet-colored flowers. It is a native of the south of Europe and of many parts of Asia, as far as China. It is cultivated in many countries of Europe, chiefly in Spain, and to some extent in the south of England, where its cultivation is at least as old as the times of Elizabeth. The roots are extensively employed by porter-brewers. They are not imported into Britain in considerable quantity, but the black inspissated extract of them (*black sugar* or *stick licorice*) is largely imported from the s. of Europe, in rolls or *sticks*, packed in bay-leaves, or in boxes of about two cwt., into which it has been run. Licorice is propagated by slips; and after a plantation has been made, almost three years must elapse before the roots can be digged up for use. The whole roots are then taken up. Licorice requires a deep, rich, loose soil, well trenched and manured; the roots penetrating to the depth of more than a yard, and straight tap-roots being most esteemed. The old stems are cleared off at the end of each season, and the root stocks so cut away as to prevent overgrowth above ground next year. The plant is propagated by cuttings of the root-stocks.—The roots of the PRICKLY LICORICE (*G. echinata*) are used in the same way, chiefly in Italy and Sicily, Russia, and the east. The only American species is *G. lepidota*, which grows in the plains of the Missouri.

LICTORS (according to Aulus Gellius, from *ligare*, to bind, because the lictors had to bind the hands and feet of criminals before punishing them) were, among the Romans, the official attendants of magistrates of the highest rank. They carried the *fusces* (q. v.) before the magistrates, clearing the way, and enforcing the use of the appropriate marks of respect. It was their duty to execute the punishments ordered by the magistrates, such as scourging with rods and beheading. They were originally free men of the plebeian order, and not till the time of Tacitus could the office be held by freedmen. Slaves were never appointed lictors.

LIDDELL, HENRY GEORGE, D.D., b. England, 1811; graduated at Christchurch, Oxford, 1833, with high honors; was head-master of Westminster school for a time; and in 1862 was chaplain extraordinary to the queen. He was appointed dean of Christ church in 1855, and vice-chancellor in 1870. He wrote a *History of Rome from the Earliest Times to the Establishment of the Empire*.

LIDDON, HENRY PARRY, D.D., b. England, 1830; graduated at Christchurch, Oxford, in 1850; was vice-principal of the theological college, Cuddesdon, from 1854 to 1859; became prebendary in Salisbury cathedral in 1864, and in 1870 was installed canon resident of St. Paul's, London, and appointed professor of exegesis at Oxford. He was appointed Bampton lecturer in 1866. He holds with the strict ecclesiastical party in the church of England; has a logical mind, a fervent spirit, and deep theological learning; and is regarded as unsurpassed for eloquence by any preacher in the national church. He has published a volume of *Lenten Sermons*, and his Bampton lectures on *The Divinity of Our Lord and Savior Jesus Christ* have given him a high reputation.

LIE, in point of law, is not a ground of action, unless in peculiar circumstances. If, for example, it is material and is uttered by a witness or deponent, it is the criminal offense of perjury. Sometimes, also, if a person, knowing that another will act upon his information, tell a lie, and which is believed to be true, and acted on, and damage follows, the party telling the lie may be sued for the damages. But in other cases, lying *per se* is not punishable by law, civilly or criminally.

LIEBER, FRANCIS, LL.D., 1800-72; b. at Berlin, Prussia. His parents were in moderate circumstances, but gave him excellent opportunities for study. When only 15 years old, leaving the study of medicine, Lieber enlisted for the Waterloo campaign, and at the battle of Namur was severely wounded. After Napoleon's overthrow he resumed his studies with ardor, and soon, becoming imbued with liberal political ideas, was accused of plotting against the government and imprisoned. The charges never came to trial, but on his discharge permission to re-enter the gymnasium of Berlin was refused. In 1820 he took his degree at Jena, and was at Dresden when the Greek struggle for independence excited his sympathy; an account of the part he took in that revolution is given in his *Journal in Greece* (1823). In 1822 he found his way to Rome, where he became a welcome inmate of the family of the great historian Niebuhr. With him

Lieber returned to Berlin, and was rearrested on allegations of disloyalty based on the old charges. After a short imprisonment at Köpnick, enlivened by the composition of a number of poems, he was released through the efforts of his friend Niebuhr; and, wearied by this constant persecution for opinion's sake, left his native country forever. For a short time he resided as a teacher in London, but in 1827 he embarked for the new world; where, though rejected of Berlin, he was to find in the great cities of Boston, New York, and Philadelphia, a wide and respectful hearing for his profound philosophy, and universal appreciation of his political acumen. His first work, the editing of the *Encyclopædia Americana*, was completed during his five years' residence in Boston (1827-32). The next two years were spent in Philadelphia; where he was interested in educational plans in connection with Girard college; in 1835 he removed to Columbia, S. C., where he occupied the position of professor of political economy in the South Carolina university; and here he produced his greatest works: *A Manual of Political Ethics* (1838); *Legal and Political Hermeneutics* (1839); and, perhaps most important of all, *Civil Liberty and Self-Government* (1853). In the line of investigation and reflection suggested by such titles as have just been given, Dr. Lieber stands second to none. As a writer, his diction, though at times lacking in clearness, is elaborate and often eloquent. As a publicist he was singularly free from narrowness, prejudice, or a limited perception. Such writers and jurists as Story and Kent recognized in him a kindred mind. The spirit of his work is indicated in his often-repeated axiom that every obligation has its corresponding liberty, and every privilege its accompanying duty. Dr. Lieber's appointment to the chair of political economy in Columbia college, New York, was in 1856; the dissimilarity between his ideas and those of the South, as it then was, rendering a prolonged stay in South Carolina unpleasant; and shortly after he was made professor of political science in the Columbia law school. In this position he remained until his death, Oct. 2, 1852, instructing not his pupils alone, but, by his frequent publications, the whole thinking world. In 1870 Mexico and the United States agreed upon him as the final arbitrator in matters then pending between the two countries. Among his voluminous minor writings may be noted: *Reminiscences of Niebuhr*; *Essays on Property and Labor*; *Laws of Property*; *Penal Laws and the Penitentiary System*; *Prison Discipline*; *The Origin and Development of the First Constituents of Civilization*, and *Great Events Described by Great Historians*. A collection of Lieber's miscellaneous writing in 2 volumes was published in 1880; the first volume containing reminiscences, addresses, and essays; the second, contributions to political science, lectures on the constitution of the United States, and other papers. Dr. Lieber contributed many articles to European and American periodicals, and was a member of several scientific and literary societies of both continents.

LIEBER, OSCAR MONTGOMERY, 1830-62; b. Boston; son of Dr. Francis; educated as a chemist and mineralogist at the universities of Berlin and Göttingen and the school of mines at Freiburg, Saxony. He was appointed state geologist of Mississippi in 1850, and shortly afterwards wrote *The Assayer's Guide*, *The Analytical Chemist's Assistant*, and *Geology of Mississippi*, besides contributing many articles to the *Mining Magazine*. In 1854-55 he was engaged in the geological survey of Alabama, and 1856-60 held the position of mineralogical, geological, and agricultural surveyor of South Carolina. The results of his labors there appeared in four successive annual reports. In 1860 he went as geologist to Labrador with an astronomical expedition. A year later he enlisted in the confederate army, was mortally wounded at the battle of Williamsburg, and died in Richmond, Va.

LIEBHARD, JOACHIM. See *CAMERARIUS, ante*.

LIEBIG, JUSTUS VON, Baron, one of the greatest chemists of the 19th c., was b. at Darmstadt, May 12, 1803. He early showed a strong predilection for natural science. He studied at Bonn and Erlangen, and afterwards in Paris, where he attracted the attention of Alexander von Humboldt by a paper on fulminic acid. This led to his appointment, in 1824, as extraordinary professor, and in 1826 as ordinary professor of chemistry at Giessen, where he labored with great activity for more than a quarter of a century, making that small university a center of attraction to students of chemistry from all parts of Germany and from foreign countries. Many honors were conferred on him. The duke of Hesse raised him to the rank of baron. In 1852 he accepted a professorship in the university of Munich, and the charge of the chemical laboratory there; and in 1860 was appointed president of the Munich academy of sciences, as the successor of Thiersch.

Liebig labored with success in all departments of chemistry, but particularly in organic chemistry, in which he made many discoveries, and did much to improve the methods of analysis. He investigated with great care the relations of organic chemistry to physiology, pathology, agriculture, etc.; and, although many of his views have been combated, and several were abandoned by the author himself, it is, nevertheless, universally admitted that his researches have greatly advanced the science of agriculture in particular. Many of his papers are contained in the *Annalen der Chemie und Pharmacie*. He published the *Wörterbuch der Chemie* (Brunsw., 1837-51) in conjunction with Poggendorff, and also a supplement to this work (1850-52), but the discoveries of more recent years are exhibited in the later volumes. He wrote the part relative to organic chemistry in the new edition of Geiger's *Handbuch der Pharmacie* (Heidelb., 1839), published

afterwards as *Die Organische Chemie in ihrer Anwendung auf Physiologie und Pathologie*, which was translated into French and English (1842). His work on *Organic Chemistry in its Application to Agriculture* (Brunsw., 1840; English translation by Dr. Lyon Playfair, 1840; and French translation by Gerhardt, 1840), and his *Chemical Letters* (Paris, 1852), all of which have gone through numerous editions, and have been translated into different languages, are among the most valuable contributions to chemical literature made in our age. He died April 18, 1873.

LIEBIG, JUSTUS VON, Baron (*ante*). Soon after becoming professor of chemistry at Giessen, Liebig established an analytical laboratory, and it was this that constituted the great attraction which drew pupils from all parts of the world. Among the English students of practical chemistry were profs. Playfair, Gregory, and Johnston; and Americans were too numerous for impartial mention. Profs. Hofmann, Will, and Fresenius were his assistants. In 1832, in connection with prof. Geiger of Heidelberg, he established the *Annalen der Pharmacie*, to which he was a contributor till near his death in 1873. At a meeting of the British association for the advancement of science in 1838 he was requested to draw up a paper on isomeric bodies, and another on organic chemistry. It was in response to this that his work entitled *Organische Chemie in ihrer Anwendung auf Agricultur* was dedicated to the British association. It was translated into English from the manuscript by prof. Lyon Playfair in 1840 under the title *Chemistry in its Application to Agriculture and Physiology*. It was also published at Brunswick in the same year in the original German under the above title. A French translation by Gerhardt also appeared. Soon afterwards was published his *Chemische Briefe*, which had a wide circulation in England and America under the title, *Familiar Letters on Chemistry and its Relations to Commerce, Physiology, and Agriculture*. These letters created great interest in Europe and America, and were the cause of the foundation of many chemical schools in colleges and universities. His second report in 1842 to the British association, entitled *Die Thier-chemie oder Organische Chemie in ihrer Anwendung auf Physiologie und Pathologie*, and translated from the manuscript by prof. Gregory under the title, *Animal Chemistry, or Chemistry in its application to Physiology and Pathology*, was the means of calling general scientific attention to the subject of food and diet, and of renewing the study of therapeutics. Many papers from Liebig appeared in the *Annalen der Pharmacie*, which afterwards were collected in two works, one published at Leipsic in 1847, the other at Brunswick in 1848. They were translated by prof. Gregory under the titles, *Researches on the Chemistry of Food* and the *Motions of the Juices in the Animal Body*. With Poggendorff, Liebig compiled the *Hand-Wörterbuch der Chemie* in 9 vols. (Brunsw., 1837-64). He also wrote the organic chemistry in *Turner's Elements of Chemistry*. In 1848, in connection with prof. Kopp, he commenced the publication of an annual report on the progress of chemistry, which has been continued till the present time. In 1855 he published *Grundsätze der Agricultur Chemie*; in 1856 *Theorie und Praxis der Landwirthschaft*, and in 1859 *Naturwissenschaftliche Briefe über die Moderne Landwirthschaft*; all of which have been translated into several languages. He gave great attention to the subject of fermentation, and was for many years the great authority upon the subject. He regarded fermentation as the result of the action of a peculiar body whose molecules are in a state of change; producing on the fermenting body a catalytic action; and that it was not caused by the abstraction of some of its constituents by growing germs—the theory which has since supplanted his. (See **FERMENTATION, ante**, and **YEAST**.) He was for a long time engaged in controversies upon the subject, his last paper being published in 1870, in which he maintains his theory with remarkable skill. Liebig's style was both terse and elegant, flowing naturally from a clear and strong intellect, and his capacity for severe and continued work was rare. He took much interest in America, probably in consequence of the many gifted Americans who became his pupils in the laboratory at Giessen; and it has been said that he sometimes entertained thoughts of coming to the United States to reside and pursue his chemical investigations. He was made a baron in 1845 by Louis II., grand duke of Hesse-Darmstadt. His collected works were published at Leipsic and Heidelberg, in 1874.

LIECHTENSTEIN, an independent principality, the smallest in the former German confederation, has an area of only 60 sq.m., with a pop. of '76, 8,664. Liechtenstein is a mountainous district, lying on the upper Rhine, between Switzerland and the Tyrol, the latter bounding it to the n. and e., while the Rhine forms its western, and the canton of the Grisons its southern boundary. It is divided into the districts of Vadutz and Schellenberg, and the principal town is Liechtenstein (pop. 1000), formerly known as Vadutz. The products are wheat, flax, and good wines and fruit. Considerable numbers of cattle are raised. Liechtenstein, with several other small states, formed the 15th member of the German confederation, but in the *Plenum*, or full council of the diet, it had a separate vote. It furnished a contingent of 70 men to the federal army. The prince of Liechtenstein, whose family is one of the most ancient and illustrious of central Europe, possesses extensive mediatised principalities in Austria, Prussia, and Saxony, which together extend over nearly 2,200 sq.m., with a pop. of more than 600,000, and yield their proprietor an annual revenue of 1,400,000 florins. The government of Liechtenstein is administered by the aid of a chamber of representatives, who meet

annually to hold a diet, but whose acts are under the control of a council of state, which has its seat at Vienna, where the prince usually resides. The revenue of Liechtenstein is 50,000 to 60,000 florins. Now, it is not formally united with the German empire, but joins in the customs-union of Austria; and it has no army.

LIEGE (so called in French, but by the Germans *Lüttich*, and by the Flemings *Luyk*) is the most easterly province of Belgium. Area, 1106 sq.m.; pop. '76, 642,264. The southern province is hilly, rocky, healthy, and much covered with wood, in some places yielding, however, great quantities of coal and iron; but the part called the *Herveland* (north of the Weeze) is extraordinarily fertile and well cultivated, and has also splendid pasture for cattle. The valley of the Weeze is very beautiful, and exhibits an endless diversity of scenery. The railway from Aix-la-Chapelle to Liege, which passes through this valley, has had immense difficulties to overcome in the nature of the ground, and is consequently regarded as a *chef-d'œuvre* of the kind. Nearly a sixth of the whole road had to be artificially constructed. The inhabitants are Walloons.

LIEGE, capital of the province of the same name, is situated on the Meuse, immediately below its confluence with the Ourthe, in a magnificent plain. A hill rises on each side of the city, one of which is occupied by the citadel. The river which divides Liege into two parts, the old and the new town, is crossed by 17 bridges. Liege is said to be the most picturesque city in Belgium. Many of the public buildings are fine, especially the churches, of which the principal are the church of St. James (founded 1014; finished 1538), the cathedral (finished 1557), the church of St. Martin's, the church of the Holy Cross (consecrated 979), and St. Barthélémy (which has 5 naves). The palace of justice, with its paintings and 60 rooms—formerly the residence of the episcopal princes of Liege—and the university, noted for its mining-school, also deserve mention. The general interior of the city, however, is by no means pleasant; everything is blackened by the smoke of the coal-pits, which have been worked for 300 years; the streets are narrow, the houses high, badly aired, and uncleanly. The manufacture of arms is the great staple of industry. Everywhere the hammer is heard; countless forges flash out their sudden sparks; and whole streets are red with the reflection of fires. All kinds of steam-machinery, locomotives, steamboats, etc., are made here for Germany. In the immediate neighborhood are important zinc foundries. Liege is connected by railways with Brussels, Antwerp, Namur, etc. Pop. in '73, 113,774; in '75, 117,638.

Liege became the seat of a bishop in the 8th c., and continued to be so until 1794; and its bishops were reckoned among the princes of the German empire; but as it early acquired considerable magnitude and importance, its inhabitants maintained a struggle for their own independence against their bishops, in which frequent appeals were made to arms. During the wars of Louis XIV., it was several times taken and retaken.

LIEGE POUSTIE. See DEATH-BED.

LIEGNITZ, a t. of Prussia, in the government of Silesia, at the confluence of the Schwarzwasser and the Katzbach, 40 m. w.n.w. of Breslau. It has numerous educational and benevolent institutions, art-collections, and industrial museums. Cloth, leather, and tobacco are largely manufactured, and vegetables are extensively cultivated in the gardens of the suburbs. This town was, from 1164 to 1675, the residence of the dukes of Liegnitz. Here, in 1813, Blücher defeated the French. Pop. '75, 31,442, of whom about one-fifth are Catholics.

LIEN, in English and Irish law, means the security or hold over goods or land for a debt which is due. A right of lien is the right to retain goods of a third party which are in the creditor's hands, until a debt due by such party to the creditor is paid. Possession is in general essential to constitute a lien, for the moment the goods are voluntarily parted with the lien is gone. Liens are general or particular. Thus, an attorney has a general lien over his client's papers and title-deeds till the amount of his bill of costs is paid. So have bankers, dyers, calico-printers, factors. A particular lien is a lien over goods, for a debt contracted in respect of such goods, as for the price of them, or some labor expended on them. Thus, a miller has a lien on the flour he has ground, a trainer on the horse he has trained, etc. There are also maritime liens and equitable liens, which do not require possession to constitute the right. In Scotland lien is generally called detention or hypothec (see HYPOTHEC).

LI'EN (*ante*). Another division of liens is into liens by common law and liens by usage. The former occur in the ordinary contracts of bailment; the latter arise by an established general usage of trade, or special usage of the parties, and are for the most part general liens. A lien may be created by express agreement, but without such agreement the common law gives a lien to certain classes of persons; thus, persons to whom property has been pawned, common-carriers, innkeepers, etc., have a particular lien. An equitable lien is one recognized by courts of equity alone. Such liens are in the nature of a constructive trust, as the lien of a vendor of real estate for unpaid purchase money, or of the vendee of real estate who has paid part of the purchase money; but these liens are not recognized everywhere in the United States. The person claiming such a lien must not have accepted any other security, such as the note of a third person. Maritime liens differ from common law liens in that they do not rest upon possession. The owner of a ship has a lien on the cargo for his freight, the shipper has a lien

upon the ship to the amount of the goods shipped by him, a seaman has a lien upon both ship and freight for his wages, etc. A master of a vessel has a lien, by statute, in England, for his wages and for sums paid out by him, but in the United States he has no lien upon the vessel for his wages, but a lien upon the freight for his disbursements. In the United States an important class of liens has been created by statute. These are called mechanics' liens, and give to men who labor, or who furnish labor or material for the erection or repair of buildings, a lien upon such buildings, from the time they begin to labor or to furnish labor or materials. This class of liens is irrespective of possession. Another statutory lien is a judgment lien upon real property against which judgment has been rendered. Liens, as a rule, are enforced by a sale of the property upon petition to the proper court.

LIERRE, a t. of Belgium, in the province of Antwerp, 10 m. s.e. of the city of that name, at the confluence of the Great and Little Nethe. Lierre has noted breweries; extensive manufactures of linen, silk, lace, and musical instruments are carried on, and there are several sugar-refineries and oil-mills. Pop. '76, 16,103.

LIEUTENANT (Fr. from Lat. *locum-tenens*, holding the place of another), a term applied to a variety of offices of a representative kind. Thus, in military matters, a *lieutenant-general* personates with each division of an army the general-in-chief. A *lieutenant-colonel* (q.v.) commands a battalion for a colonel in the latter's absence. But the title lieutenant, without qualification, denotes the second officer and deputy, or *locum-tenens*, of the captain in each company of cavalry or infantry. A lieutenant in the British foot-guards ranks as captain in the army, and exchanges with a captain in another regiment.—*Captain-lieutenant*, an obsolete rank, was the subaltern who commanded the "colonel's company" in each regiment.—A *second-lieutenant* is the junior subaltern of a company, and corresponds to what formerly was an ensign (q.v.). The pay of a lieutenant varies from 10s. 4d. a day in the life-guards to 6s. 6d. in the line.

In the British navy lieutenant is a misnomer in the case of the officer bearing that title. His functions in all respects correspond to those of a captain in the army, with whom he ranks, and with whom he also nearly matches in regard to pay. A lieutenant's full pay is 10s. a day; and his half-pay ranges, according to length of services, from 4s. to 7s. a day. Six years' service afloat are requisite to qualify an officer for the rank of lieutenant, and the candidate has also to pass a satisfactory examination in seamanship and general professional knowledge. As leaders in all minor enterprises, such as boat expeditions, cutting out, etc., lieutenants in war time carry off most of the laurels awarded to actions of singular personal daring.

LIEUTENANT (ante). In the U. S. army and marine service, the rank next following that of captain, and of which there are two grades, first and second lieutenant, the latter being the lowest commissioned officer. These grades rank with those of master and ensign in the U. S. navy.

LIEUTENANT, LORD-, OF A COUNTY, a permanent provincial governor appointed by the sovereign by patent under the great seal. The office, in England, arose from the occasional commissions of array issued by the crown in times of danger or disturbance, requiring experienced persons to muster the inhabitants of the counties to which the commissioners were sent, and set them in military order. The right of the crown to issue such commissions was denied by the long parliament, this question proving the immediate cause of the breach between Charles I. and his subjects. Their legality was established at the restoration by a declaratory act. The lord-lieutenant is now the permanent local representative of the crown, who, on the occasion of an invasion or rebellion, has power to raise the militia, form regiments, troops, and companies, and give commissions to officers. The history of the office seems to have been somewhat similar in Scotland. In act 1438 c. 3, the "lieutenant" is commanded to "raise the county" whenever it may be necessary to bring the rebellious and unruly possessors of castles and fortalices into subjection; and though his powers were executive rather than judicial, he seems sometimes to have had authority to exercise the functions of the sheriff, or overrule his decisions. The lord-lieutenant of a county is at the head of the magistracy, the militia, and the yeomanry; he nominates officers of militia and volunteers, and is the chief executive authority, forming the settled channel of communication between the government and the magistracy, and considered as responsible in cases of emergency for the preservation of public tranquillity. Under him are permanent deputy-lieutenants appointed by him.

LIEUTENANT, LORD-, OF IRELAND, the viceroy or deputy of the sovereign to whom the government of Ireland is committed. The office has existed from a remote period, the appointment having been made under different designations. His powers were in early times very extensive, almost regal. For the last half century following the revolution the lord-lieutenant resided little in Ireland, visiting it only once in two years to hold the session of parliament. Some lords-lieutenant never went to Ireland at all, and occasionally, instead of a viceroy, lords-justices (see JUSTICES, LORDS-) were appointed.

The lord-lieutenant is appointed under the great seal of the United Kingdom, and bears the sword of state as the symbol of his viceregal office. He has the assistance of a privy-council of 58 members, appointed by the sovereign, and of officers of state. He

is commissioned to keep the peace and the laws and customs of Ireland, and to see that justice is impartially administered. He has the control of the police, and may issue orders to the general commanding the troops for the support of the civil authority, the protection of the public, the defense of the kingdom, and the suppression of insurrection. He may confer knighthood, and, previous to its disestablishment, had the disposal of church preferment, as well as all the other patronage of the country. The granting of money, and lands, and pensions, of all titles of honor except simple knighthood, the appointment of privy-councilors, judges, law officers, and governors of forts, and the appointment to military commissions, are reserved to the sovereign, acting, however, on the lord-lieutenant's advice and recommendation. No complaint of injustice or oppression in Ireland will be entertained by the sovereign until first made to the lord-lieutenant, who is in no case required to execute the royal instructions in a matter of which he may disapprove until he can communicate with the sovereign and receive further orders. Yet, notwithstanding the dignity and responsibility of his office, the lord-lieutenant acts in every matter of importance under the direct control of the cabinet of Great Britain. The views and opinions of the cabinet on all the more important questions connected with his government are communicated to him by the home secretary, who is held responsible for the government of Ireland, and with whom it is the duty of the lord-lieutenant to be in close correspondence; on matters of revenue he must be in constant communication with the treasury. On his occasional or temporary absence from Ireland, lords-justices are appointed, who are usually the lord primate, the lord chancellor, and the commander of the forces. His salary is £20,000, with a residence in Dublin castle as well as one in Phoenix Park. His tenure of office depends on that of the ministry, of which he is a member. By act 10 Geo. IV. c. 7, a Roman Catholic is ineligible for the lieutenancy of Ireland.

LIEUTENANT-COLONEL, in the British army, is nominally the second officer in a regiment; but virtually a lieutenant-colonel commands every battalion of infantry and regiment of cavalry, the post of colonel being merely an honorable sinecure, with usually £1000 a year attached, awarded to a general officer. The lieutenant-colonel is responsible for the discipline of his battalion, the comfort of his men, and ultimately for every detail connected with their organization. He is aided by the major and adjutant. In the artillery and engineers, where the rank of colonel is a substantive rank, with tangible regimental duties, the functions of lieutenant-colonel are more limited, one having charge of every two batteries of artillery, or two companies of engineers. The pay of a lieutenant-colonel varies from £1 9s. 2d. per diem in the household cavalry to 17s. in the infantry of the line. Five years' regimental service as lieutenant-colonel entitles an officer to brevet rank as colonel, which, while improving his position in the army, does not, however, affect his status in his regiment.

LIEUTENANT-COLONEL (*ante*). That rank in the U. S. army next above major and next below colonel, and answering to that of commander in the navy.

LIEUTENANT-GENERAL. See **GENERAL OFFICER**.

LIEUTENANT-GENERAL (*ante*). In the U. S. army, the rank next beneath that of general; the latter, under the president, being commander-in-chief. It was first authorized by congress in 1798 and bestowed upon gen. Washington in view of the then anticipated war with France. After Washington's death the rank remained in abeyance until 1855, when it was revived (in brevet) by congress for gen. Winfield Scott, at whose death it again lapsed. In 1864 it was again revived by special act, and conferred on gen. U. S. Grant, on whose promotion by the creation of the grade of general in his behalf maj.gen. William T. Sherman became lieutenant-general; and, on his succession to the rank of general, maj.gen. Philip H. Sheridan was promoted to be lieutenant-general, and still (1880) holds that rank.

LIEVEN, DOROTHEA, Princess of, 1785-1857; b. Riga; daughter of Christoph von Benkendorff, an Esthonian of the middle class; was brilliantly educated, and when quite young was married to prince Christoph Lieven, Russian ambassador at the court of Prussia. Established in Berlin, she displayed remarkable diplomatic aptitude, while gaining an important social position through the exercise of fascinating personal qualities. Her correspondence became very extensive, and she soon enjoyed a continental reputation. On her husband's appointment to the court of St. James in 1812, she simply changed the immediate field of her influence and speedily established herself in a firm position in political and fashionable society in London. In 1834 the prince became governor of the czarovich, Alexander II., and was greatly assisted in his important functions by the comprehensive capacity of his wife. In 1837 the princess removed her residence to Paris, and two years later her husband died in Rome, after which period she resided permanently in the French capital. Here she was universally sought after by the most important personages in diplomacy, and her saloon was the center of schemes and intrigues, having for their subjects the interests of half of Europe. She began to fail in health early in 1857, but retained her faculties to the last.

LIFE. In seeking a definition of life, it is difficult to find one that does not include more than is necessary, or exclude something that should be taken in. Richerand's definition of life, that it is "a collection of phenomena which succeed each other during

a limited time in an organized body," is equally applicable to the decay which goes on after death. According to De Blainville, "life is the twofold internal movement of composition and decomposition, at once general and continuous." As Mr. Herbert Spencer in his *Principles of Biology* well observes, this conception is in some respects too narrow, and in other respects too wide. Thus, it excludes those nervous and muscular functions which form the most conspicuous and distinctive classes of vital phenomena, while it equally applies to the processes going on in a living body and in a galvanic battery. Mr. Spencer (in 1852) proposed to define life as the "co-ordination of actions," but as he observes, "like the others, this definition includes too much, for it may be said of the solar system, with its regularly recurring movements and its self-balancing perturbations, that it also exhibits co-ordination of actions." His present and amended conception of life is: "The definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with external co-existences and sequences." One of the latest definitions of life is that which has been suggested by Mr. G. H. Lewes: "Life is a series of definite and successive changes, both of structure and composition, which take place within an individual without destroying its identity." This is, perhaps, as good a definition as has yet been given; but no one of those we have quoted is more than approximately true, and a perfect definition of life seems to be an impossibility.

LIFE. See **BIOLOGY.**

LIFE, MEAN DURATION OF. By this term is meant the average length of life enjoyed by a given number of persons of the same age. Suppose we look at the Northampton table of mortality, we find that, of 3,635 persons aged 40, 3,559 reach 41, 3,482 reach 42, and so on, the whole failing at ninety-six. The average age, then, attained by the 3,635 persons being ascertained on these data would be the mean duration of life after the age of forty has been reached. Suppose, then, that a be the given number alive at a given age by a given mortality table, and b the number alive at the end of the first year, c the number alive at the end of the second, and so on; then there die at the end of the first year, $a-b$; and assuming that those who have died have, on an average, lived half a year, the aggregate length of life enjoyed by those who have died during the first year will be $\frac{1}{2}(a-b)$ years; then b being still alive, the a persons have enjoyed, at the end of the first year, $\frac{1}{2}(a-b)+b = \frac{1}{2}(a+b)$ years. In the second year, the a persons enjoy $\frac{1}{2}(b+c)$; in the third, the c persons enjoy $\frac{1}{2}(c+d)$ years; and so on. Summing these, and dividing by the original number of lives, so as to ascertain the average, gives $\frac{1}{a} + \frac{b+c+d}{a}$; hence the rule: Add the numbers alive at each age above that given, divide

by the number alive at the given age, and add half a year. The mean duration of life at a given age is often called the "expectation of life;" but this is clearly a wrong term to use. Of 1000 lives at twenty, suppose 500 to reach forty-five; then a man aged twenty has an equal chance of reaching forty-five, and twenty-five years would be his expectation of life. But it clearly does not follow that taking the 500 who have not reached twenty-five, along with the 500 who have survived it, we should find, on extinction of the whole, that the mean duration was twenty-five years. It might be either greater or less. The term "expectation of life," as generally applied by assurance companies to denote mean duration, is, therefore, a wrong one. In connection with this subject, see **MORTALITY**; also **MAN**.

LIFE-ASSURANCE. See **INSURANCE.**
